About PBS Documentation

The PBS Professional Documentation

The documentation for PBS Professional includes the following:

**PBS Professional Administrator’s Guide:**
How to configure and manage PBS Professional. For the PBS administrator.

**PBS Professional Quick Start Guide:**
Quick overview of PBS Professional installation and license file generation.

**PBS Professional Installation & Upgrade Guide:**
How to install and upgrade PBS Professional. For the administrator.

**PBS Professional User’s Guide:**
How to submit, monitor, track, delete, and manipulate jobs. For the job submitter.

**PBS Professional Programmer’s Guide:**
Discusses the PBS application programming interface (API). For integrators.

**PBS Professional Reference Guide:**
Covers PBS reference material.

**PBS Manual Pages:**
PBS commands, resources, attributes, APIs.

Where to Keep the Documentation

To make cross-references work, put all of the PBS guides in the same directory.

Ordering Software and Publications

To order additional copies of this manual and other PBS publications, or to purchase additional software licenses, contact your Altair sales representative at pbssales@altair.com.
About PBS Documentation

Document Conventions

PBS documentation uses the following typographic conventions:

**abbreviation**

The shortest acceptable abbreviation of a command or subcommand is underlined.

**command**

Commands such as `qmgr` and `scp`

**input**

Command-line instructions

**manpage(x)**

File and path names. Manual page references include the section number in parentheses appended to the manual page name.

**format**

Syntax, template, synopsis

**Attributes**

Attributes, parameters, objects, variable names, resources, types

**Values**

Keywords, instances, states, values, labels

**Definitions**

Terms being defined

**Output**

Output, example code, or file contents

**Examples**

Examples

**Filename**

Name of file

**Utility**

Name of utility, such as a program
This chapter describes the terms used in PBS Professional documentation.

**Accept an action (Hooks)**

A hook accepts an action when the hook allows the action to take place.

**Access control list, ACL**

An ACL, or Access Control List, is a list of users, groups, or hosts from which users or groups may be attempting to gain access. This list defines who or what is allowed or denied access to parts of PBS such as the server, queues, or reservations. A server ACL applies to access to the server, and therefore all of PBS. A queue’s ACL applies only to that particular queue. A reservation’s ACL applies only to that particular reservation. See "ACLs" on page 793 in the PBS Professional Administrator’s Guide.

**Access to a queue**

Applies to users, groups, and hosts. Being able to submit jobs to the queue, move jobs into the queue, being able to perform operations on jobs in the queue, and being able to get the status of the queue.

**Access to a reservation**

Applies to users, groups, and hosts. Being able to place jobs in the reservation, whether by submitting jobs to the reservation or moving jobs into the reservation. It also means being able to delete the reservation, and being able to operate on the jobs in the reservation.

**Access to the server**

Applies to users, groups, and hosts. Being able to run PBS commands to submit jobs and perform operations on them such as altering, selecting, and querying status. It also means being able to get the status of the server and queues.

**Account**

An account is an arbitrary character string, which may have meaning to one or more hosts in the batch system. Frequently, an account is used as a grouping for charging for the use of resources.

**Action (Hooks)**

A PBS operation or state transition. The actions that hooks can affect are submitting a job, altering a job, running a job, making a reservation, and moving a job to another queue.
Chapter 1  

Glossary of Terms

Active (Failover)
A server daemon is active when it is managing user requests and communicating with the scheduler and MoMs.

Active Directory (Windows)
Active Directory is an implementation of LDAP directory services by Microsoft to use in Windows environments. It is a directory service used to store information about the network resources (e.g. user accounts and groups) across a domain.

Admin (Windows)
A user logged in from an account that is either:
1. A member of a group having full control over the local computer and the domain controller
2. Allowed to make domain and schema changes to the Active Directory.

Administrator, PBS Administrator
A person who administers PBS, performing functions such as downloading, installing, upgrading, configuring, or managing PBS. A PBS administrator must have an account with Manager privilege and an account with root privilege. Administrator is distinguished from “site administrator”, although often these are the same person.
The term PBS Administrator is used in PBS documentation to mean the above, rather than to indicate a user role recognized by PBS Professional.

Administrators (Windows)
A group that has built-in capabilities that give its members full control over the local system, or the domain controller host itself.

Advance reservation
A reservation for a specific set of resources for a specified start time and duration in the future. Advance reservations are created by users to reserve resources for jobs. The reservation is available only to the creator of the reservation and any users or groups specified by the creator.

AOE, Application operating environment
The environment on a vnode. This may be one that results from provisioning that vnode, or one that is already in place.

API
PBS provides an Application Programming Interface, or API, which is used by the commands to communicate with the server. This API is described in the PBS Professional Programmer’s Guide. A site may make use of the API to implement new commands if so desired.
Glossary of Terms

Application Checkpoint
The application performs its own checkpointing when it receives the appropriate signal etc.

Array job
See "Job array".

Attribute
An attribute is a data item belonging to an object. The attribute’s value affects the behavior of or provides information about the object. A job’s owner can set the attributes of a job, and the administrator can set attributes of queues and vnodes.

Backfilling
A scheduling policy where
1. High-priority jobs are scheduled for execution
2. Lower-priority jobs are run if the following conditions are true:
   - Resources (that cannot be used by the high-priority jobs) are available
   - The lower-priority jobs will not delay the higher-priority jobs
Lower-priority jobs selected for execution are those next in priority order that will fit in the available resources.

Batch, Batch processing
Allowing jobs to be run outside of the interactive login environment.

Borrowing vnode
The vnode where a shared vnode resource is available, but not managed.

Built-in hook
A hook that is supplied as part of PBS. These hooks cannot be created or deleted by administrators. See "Managing Built-in Hooks" on page 634 in the PBS Professional Administrator’s Guide.

Built-in resource
A resource that is defined in PBS Professional as shipped. Examples of built-in resources are ncpus, which tracks the number of CPUs, and mem, which tracks memory. See "Built-in and Custom Resources" on page 311 in the PBS Professional Administrator’s Guide.

Checkpoint/Rerstart
Allows jobs to be checkpointed and restarted. Uses OS-provided or third-party checkpoint/restart facility.
Chapter 1

Glossary of Terms

**Checkpoint and Abort, checkpoint_abort**

The checkpoint script or tool writes a restart file, then PBS kills and requeues the job. The job resumes from the start file when it is executed again.

**Chunk**

A set of resources allocated as a unit to a job. Specified inside a selection directive. All parts of a chunk come from the same host. In a typical MPI (Message-Passing Interface) job, there is one chunk per MPI process.

**Chunk-level resource, host-level resource**

A resource that is available at the host level, for example, CPUs or memory. Chunk resources are requested inside of a selection statement. The resources of a chunk are to be applied to the portion of the job running in that chunk.

Chunk resources are requested inside a select statement. A single chunk is requested using this form:

```bash
-l select=<resource name>=<value>:<resource name>=<value>
```

For example, one chunk might have 2 CPUs and 4GB of memory:

```bash
-l select=ncpus=2:mem=4gb
```

To request multiples of a chunk, prefix the chunk specification by the number of chunks:

```bash
-l select=[number of chunks]<chunk specification>
```

For example, to request six of the previous chunk:

```bash
-l select=6:ncpus=2:mem=4gb
```

To request different chunks, concatenate the chunks using the plus sign (“+”):

```bash
-l select=[number of chunks]<chunk specification>+[number of chunks]<chunk specification>
```

For example, to request two kinds of chunks, one with 2 CPUs per chunk, and one with 8 CPUs per chunk, both kinds with 4GB of memory:

```bash
-l select=6:ncpus=2:mem=4gb+3:ncpus=8:mem=4GB
```

**Chunk set**

An identical set of chunks requested in a select statement. The following is a chunk set: 4:ncpus=8:mem=4GB

**Cluster**

A relatively homogeneous set of systems that are used as if they are a single machine.

**Commands**

PBS supplies both command line programs that are POSIX 1003.2d conforming and a graphical interface. These are used to submit, monitor, modify, and delete jobs.
These client commands can be installed on any system type supported by PBS and do not require the local presence of any of the other components of PBS.

There are three classifications of commands: user commands (which any authorized user can use), Operator commands, and Manager (or administrator) commands. Operator and Manager commands require specific access privileges.

**Communication daemon, comm**

The daemon which handles communication between the server, scheduler, and MoMs. Executable is `pbs_comm`.

**Complex**

A PBS complex consists of the machines running one primary server+Scheduler (plus, optionally, a secondary backup server+Scheduler) and all the machines on which the MoMs (attached to this server+Scheduler) are running. A complex can be a heterogeneous mix of system architectures, and can include one or more clusters.

**Consumable resource**

A consumable resource is a resource that is reduced or taken up by being used. Examples of consumable resources are memory or CPUs. See "Consumable and Non-consumable Resources" on page 312 in the PBS Professional Administrator’s Guide.

**CPU**

Has two meanings, one from a hardware viewpoint, and one from a software viewpoint:

1. A core. The part of a processor that carries out computational tasks. Some systems present virtual cores, for example in hyperthreading.
2. Resource required to execute a program thread. PBS schedules jobs according, in part, to the number of threads, giving each thread a core on which to execute. The resource used by PBS to track CPUs is called “ncpus”. The number of CPUs available for use defaults to the number of cores reported by the OS. When a job requests one CPU, it is requesting one core on which to run.

**Creating a hook**

When you “create a hook” using `qmgr`, you’re telling PBS that you want it to make you an empty hook object that has no characteristics other than a name.

**Custom resource**

A resource that is not defined in PBS as shipped. Custom resources are created by the PBS administrator or by PBS for some systems. See "Built-in and Custom Resources" on page 311 in the PBS Professional Administrator’s Guide.
Chapter 1  Glossary of Terms

Degraded reservation
An advance reservation for which one or more associated vnodes are unavailable. A standing reservation for which one or more vnodes associated with any occurrence are unavailable.

Delegation (Windows)
A capability provided by Active Directory that allows granular assignment of privileges to a domain account or group. So for instance, instead of adding an account to the “Account Operators” group which might give too much access, delegation allows giving the account read access only to all domain users and groups information. This is done via the Delegation wizard.

Destination, destination queue
A queue where a job is sent. A destination may be at the same PBS server or at another server.

Destination identifier
The string that names a destination queue. It is composed of two parts and has the following format:

queue@server
where

server
The name of a PBS server

queue
The string identifying a queue on that server.

Directive
A means by which the user specifies to PBS the value of a job submission variable such as number of CPUs, the name of the job, etc. The default start of a directive is “#PBS”. PBS directives either specify resource requirements or attribute values. See page “Changing the Directive Prefix”, on page 29 of the PBS Professional User’s Guide.

Domain Admin Account (Windows)
A domain account on Windows that is a member of the “Domain Admins” group.

Domain Admins (Windows)
A global group whose members are authorized to administer the domain. By default, the Domain Admins group is a member of the Administrators group on all computers that have joined a domain, including the domain controllers.

Domain User Account (Windows)
A domain account on Windows that is a member of the Domain Users group.
Glossary of Terms

Domain Users (Windows)
A global group that, by default, includes all user accounts in a domain. When you create a user account in a domain, it is added to this group automatically.

Endpoint
A PBS server, scheduler, or MoM daemon.

Enterprise Admins (Windows)
A group that exists only in the root domain of an Active Directory forest of domains. The group is authorized to make forest-wide changes in Active Directory, such as adding child domains.

Entity, PBS entity
A user, group, or host.

Entity share
Setting job execution and/or preemption priority according to how much of the fair-share tree is assigned to each job’s owner.

Event
A PBS operation or state transition. Also called action. For a list of events, see "Event Types" on page 540 in the PBS Professional Administrator’s Guide.

Execution event hook
A hook that runs at an execution host. These hooks run after a job is received by MoM. Execution event hooks have names prefixed with “execjob_”.

Execution host
A computer which runs PBS jobs. An execution host is a system with a single operating system (OS) image, a unified virtual memory space, one or more CPUs and one or more IP addresses. Systems like Linux clusters, which contain separate computational units each with their own OS, are collections of hosts. Systems such as the SGI ICE are also collections of hosts. The SGI Altix 4700 is a single execution host.

An execution host can be comprised of one or more vnodes. For example, the SGI Altix 4700, while being a single execution host, can contain multiple vnodes, where each vnode is a blade. On the SGI ICE, each blade is treated as a vnode. See "Vnode".

Execution queue
A queue from which a job can be executed.

Failover
The PBS complex can run a backup server. If the primary server fails, the secondary takes over without an interruption in service.
Chapter 1

Glossary of Terms

Failure action
The action taken when a hook fails to execute. Specified in the fail_action hook attribute. See "Using the fail_action Hook Attribute" on page 473 in the PBS Professional Administrator’s Guide.

Fairshare
A scheduling policy that prioritizes jobs according to how much of a specified resource is being used by, and has recently been used by, job submitters. Job submitters can be organized into groups and subgroups, so that jobs can also be prioritized according to those groups’ resource usage. Users and groups can each be allotted a percentage of total resource usage. See "Using Fairshare" on page 179 in the PBS Professional Administrator’s Guide.

File staging
File staging is the transfer of files between a specified storage location and the execution host. See "Stage in" and "Stage out".

Finished jobs
Jobs whose execution is done, for any reason:
- Jobs which finished execution successfully and exited
- Jobs terminated by PBS while running
- Jobs whose execution failed because of system or network failure
- Jobs which were deleted before they could start execution

Floating license
A unit of license dynamically allocated (checked out) when a user begins using an application on some host (when the job starts), and deallotted (checked in) when a user finishes using the application (when the job ends).

Furnishing queue/complex
In peer scheduling, the queue/complex from which jobs are pulled to be run at another queue/complex

Generic group limit
A limit that applies separately to groups at the server or a queue. This is the limit for groups which have no individual limit specified. A limit for generic groups is applied to the usage across the entire group. A separate limit can be specified at the server and each queue.

Generic project limit
Applies separately to projects at the server or a queue. The limit for projects which have no individual limit specified. A limit for generic projects is applied to the usage across the entire project. A separate limit can be specified at the server and each queue.
Generic user limit
A limit that applies separately to users at the server or a queue. This is the limit for users who have no individual limit specified. A separate limit for generic users can be specified at the server and at each queue.

Global resource
A global resource is defined in a resources_available attribute, at the server, a queue, or a host. Global resources can be operated on via the qmgr command and are visible via the qstat and pbsnodes commands. See "Global and Local Resources" on page 313 in the PBS Professional Administrator’s Guide.

Group
A collection of system users. A user must be a member of at least one group, and can be a member of more than one group.

Group access, Access by group
Refers to access to PBS objects, such as the server, queues, and reservations. A user in the specified group is allowed access at the server, queues, and reservations

Group ID (GID)
Unique numeric identifier assigned to each group. See "Group".

Group limit
Refers to configurable limits on resources and jobs. This is a limit applied to the total used by a group, whether the limit is a generic group limit or an individual group limit.

History jobs
Jobs which will no longer execute at this server:
•  Moved jobs
•  Finished jobs

Hold
A restriction which prevents a job from being executed. When a job has a hold applied to it, it is in the Held (H) state. See section 2.47, “qhold”, on page 155.

Hook
Hooks are custom executables that can be run at specific points in the execution of PBS. They accept, reject, or modify the upcoming action. This provides job filtering, patches or workarounds, and extends the capabilities of PBS, without the need to modify source code.

Host
A machine running an operating system. A host can be made up of one or more vnodes. All vnodes of a host share the same value for resources_available.host.
Chapter 1

Glossary of Terms

Host access, Access by host
Refers to user access at the server, queues, and reservations from the specified host.

Idle
A server daemon is idle when it is running, but only accepting handshake messages, not performing workload management.

Importing a hook
When you “import a hook” using `qmgr`, you’re telling PBS which Python script to run when the hook is triggered.

Importing a hook configuration file
When you “import a hook configuration file” using `qmgr`, you’re telling PBS which file should be stored as the configuration file for the specified hook.

Indirect resource
A shared vnode resource at vnode(s) where the resource is not defined, but which share the resource.

Individual group limit
Applies separately to groups at the server or a queue. This is the limit for a group which has its own individual limit specified. An individual group limit overrides the generic group limit, but only in the same context, for example, at a particular queue. The limit is applied to the usage across the entire group. A separate limit can be specified at the server and each queue.

Individual project limit
Applies separately to projects at the server or a queue. Limit for a project which has its own individual limit specified. An individual project limit overrides the generic project limit, but only in the same context, for example, at a particular queue. The limit is applied to the usage across the entire project. A separate limit can be specified at the server and each queue.

Individual user limit
Applies separately to users at the server or a queue. This is the limit for users who have their own individual limit specified. A limit for an individual user overrides the generic user limit, but only in the same context, for example, at a particular queue. A separate limit can be specified at the server and each queue.

Installation account
The account used by the administrator when installing PBS. Not the `pbsadmin` account used by PBS.

Interactive job
A job where standard input and output are connected to the terminal from which the job was submitted.
Job or Batch job
A unit of work managed by PBS. A job is a related set of tasks, created and submitted by the user. The user specifies the resources required by the job, and the processes that make up the job. When the user submits a job to PBS, the user is handing off these tasks to PBS to manage. PBS then schedules the job to be run, and manages the running of the job, treating the tasks as parts of a whole. A job is usually composed of a set of directives and a shell script.

Job array
A job array is a container for a collection of similar jobs submitted under a single job ID. It can be submitted, queried, modified and displayed as a unit. The jobs in the collection are called subjobs. For more on job arrays, see "Job Arrays", on page 209 of the PBS Professional User’s Guide.

Job array identifier
The identifier returned upon success when submitting a job array. The format is
sequence_number[]
or
sequence_number[].server.domain.com.
Note that some shells require you to enclose a job array identifier in double quotes.

Job array range
A specification for a set of subjobs within a job array. When specifying a range, indices used must be valid members of the job array’s indices. Format:
sequence_number[<first>-<last>:<step>][.server][@new server]

first is the first index of the subjobs.
last is the last index of the subjobs.
step is the stepping factor.

Job ID, Job identifier
When a job is successfully submitted to PBS, PBS returns a unique identifier for the job. Format:
sequence_number[.server][@new server]

Job state
A job exists in one of the possible states throughout its existence within the PBS system. For example, a job can be queued, running, or exiting. See "States" on page 429.

Job Submission Description Language (JSDL)
Language for describing the resource requirements of jobs.
Job-wide resource, server resource, queue resource

A job-wide resource, also called a server-level or queue-level resource, is a resource that is available to the entire job at the server or queue.

A job-wide resource is available to be consumed or matched at the server or queue if you set the server or queue resources_available.<resource name> attribute to the available or matching value. For example, you can define a custom resource called FloatingLicenses and set the server’s resources_available.FloatingLicenses attribute to the number of available floating licenses.

Examples of job-wide resources are shared scratch space, licenses, or walltime.

A job can request a job-wide resource for the entire job, but not for individual chunks. Job-wide resources are requested outside of a selection statement, in this form:

-\l keyword=value[,keyword=value ...]

where keyword identifies either a consumable resource or a time-based resource such as walltime.

A resource request “outside of a selection statement” means that the resource request comes after “-l”, but not after “-lselect=”.

Kill a job

To terminate the execution of a job.

Leaf

An endpoint (a server, scheduler, or MoM daemon.)

License Manager Daemon (lmx-serv-altair)

Daemon that functions as the license server.

License server

Manages licenses for PBS jobs.

License Server List Configuration

One form of redundant license server configuration. A collection of license server files, or "<port>@<host>" settings, pointing to license servers managing Altair licenses. Each server on the list is tried in turn. There could be X licenses on <server1>, Y licenses on <server2>, and Z licenses on <server3>, and the total licenses available would actually be X+Y+Z, but a request must be satisfied only by one server at a time. The first running server is the only server queried.
Limit
A maximum that can be applied in various situations:
• The maximum number of jobs that can be queued
• The maximum number of jobs that can be running
• The maximum number of jobs that can be queued and running
• The maximum amount of a resource that can be allocated to queued jobs
• The maximum amount of a resource that can be consumed at any time by running jobs
• The maximum amount of a resource that can be allocated to queued and running jobs

Load balance
Scheduling policy wherein jobs are distributed across multiple hosts to even out the workload on each host.

Local resource
A local resource is defined in a Version 1 MoM configuration file. Local resources cannot be operated on via the qmgr command and are not visible via the qstat and pbsnodes commands. Local resources can be used by the scheduler. See "Global and Local Resources" on page 313 in the PBS Professional Administrator’s Guide.

Manager
A person who has been granted Manager privilege by being listed in the server’s managers attribute. A Manager is authorized to use all restricted capabilities of PBS. A PBS Manager may act upon the server, queues, or jobs. See "Manager" on page 790 in the PBS Professional Administrator’s Guide.

Managing vnode
The vnode where a shared vnode resource is defined, and which manages the resource.

Master provisioning script, Master script (Hooks)
The script that makes up the provisioning hook.

Memory-only vnode
Represents a node board that has only memory resources (no CPUs), for example, an Altix memory-only blade.
Chapter 1  Glossary of Terms

MoM
The daemon which runs on an execution host, managing the jobs on that host. MoM is the informal name for the process called pbs_mom. One MoM runs on each execution host.

MoM runs each job when it receives a copy of the job from the server. MoM creates a new session that is as identical to the user's login session as possible. For example under UNIX, if the user's login shell is csh, then MoM creates a session in which .login is run as well as .cshrc. MoM returns the job's output to the user when directed to do so by the server.

MoM is a reverse-engineered acronym that stands for “Machine Oriented Mini-server”.

Monitoring
The act of tracking and reserving system resources and enforcing usage policy. This covers both user-level and system-level monitoring as well as monitoring running jobs. Tools are provided to aid human monitoring of the PBS system as well.

Mother Superior
Mother Superior is the MoM on the head or first host of a multihost job. Mother Superior controls the job, communicates with the server, and controls and consolidates resource usage information. When a job is to run on more than one execution host, the job is sent to the MoM on the primary execution host, which then starts the job.

Moved jobs
Jobs which were moved to another server

Node
No longer used. See "Execution host".

Non-consumable resource
A non-consumable resource is a resource that is not reduced or taken up by being used. Examples of non-consumable resources are Boolean resources and walltime. See "Consumable and Non-consumable Resources" on page 312 in the PBS Professional Administrator’s Guide.

Non-job event hook
A hook that is not directly related to a specific job. Non-job event hooks are periodic hooks, startup hooks, provisioning hooks, and reservation creation hooks.

Object, PBS object
An element of PBS such as the server, a queue, or a reservation
Occurrence of a standing reservation
An instance of the standing reservation.
An occurrence of a standing reservation behaves like an advance reservation, with the following exceptions:

- While a job can be submitted to a specific advance reservation, it can only be submitted to the standing reservation as a whole, not to a specific occurrence. You can only specify when the job is eligible to run. See the \texttt{qsub(1B)} man page.
- When an advance reservation ends, it and all of its jobs, running or queued, are deleted, but when an occurrence ends, only its running jobs are deleted.

Each occurrence of a standing reservation has reserved resources which satisfy the resource request, but each occurrence may have its resources drawn from a different source. A query for the resources assigned to a standing reservation will return the resources assigned to the soonest occurrence, shown in the \texttt{resv\_nodes} attribute reported by \texttt{pbs\_rstat}.

Operator
This term means a person who has been granted Operator privilege by being listed in the server’s \texttt{operators} attribute. An Operator can use some but not all of the restricted capabilities of PBS. See "Operator" on page 789 in the PBS Professional Administrator’s Guide.

Overall limit
Limit on the total usage. In the context of server limits, this is the limit for usage at the PBS complex. In the context of queue limits, this is the limit for usage at the queue. An overall limit is applied to the total usage at the specified location. Separate overall limits can be specified at the server and each queue.

Owner, Job owner
The user who submitted a specific job to PBS.

Parameter
A \textit{parameter} specifies an element of the behavior of a component of PBS. For example, MoMs have parameters specifying which events to log, or what the maximum load should be. Parameters are specified by editing the component’s configuration files.

\texttt{pbshook}
Keyword used by \texttt{qmgr} to operate on built-in hooks.

PBS Entity
A user, group, or host
**Glossary of Terms**

**pbs Module**

The *pbs module* is an interface to PBS and the hook environment. The interface is made up of Python objects, which have attributes and methods. You can operate on these objects using Python code.

**PBS Object**

An element of PBS such as the server, a queue, or a reservation.

**pbsadmin (Windows)**

The account that is used to execute the PBS daemons *pbs_server*, *pbs_mom*, *pbs_sched*, and *pbs_rshd* via the Service Control Manager on Windows. This must be “*pbsadmin*”.

**PBS_HOME**

The path containing PBS files. The path under which PBS files are installed on the local system.

**PBS_EXEC**

The path containing PBS executables. The path under which PBS executables are installed on the local system.

**PBS Professional**

A workload management system consisting of a server, a Scheduler, and any number of execution hosts each managed by a MoM. PBS accepts batch jobs from users, and schedules them on execution hosts according to the policy chosen by the site. PBS manages the jobs and their output according to site-specified policy.

**Peer scheduling**

A feature allowing different PBS complexes to automatically run each others’ jobs. This way jobs can be dynamically load-balanced across the complexes. Each complex involved in peer scheduling is called a *peer*.

**Placement set**

A set of vnodes on which jobs can be run, selected so that the job will run as efficiently as possible. Placement sets are used to improve task placement (optimizing to provide a “good fit”) by exposing information on system configuration and topology. See "Placement Sets" on page 224 in the PBS Professional Administrator’s Guide.

**Placement set series**

The set of placement sets defined by a resource, where each set has the same value for the resource. If the resource takes on N values, there are N placement sets in the series. See "Placement Sets" on page 224 in the PBS Professional Administrator’s Guide.
Glossary of Terms

Placement pool
All of the placement sets defined at a PBS object. Each queue can have its own placement pool, and the server can have its own placement pool. See "Placement Sets" on page 224 in the PBS Professional Administrator’s Guide.

Policy, Scheduling policy
The set of rules by which the scheduler selects jobs for execution.

POSIX
Refers to the various standards developed by the Technical Committee on Operating Systems and Application Environments of the IEEE Computer Society under standard P1003.

Preempt
Stop one or more running jobs in order to start a higher-priority job.

Preemption level
Job characteristic used to determine whether a job may preempt another or may be preempted, such as being in an express queue, starving, having an owner who is over a soft limit, being a normal job, or having an owner who is over a fairshare allotment.

Preemption method
The method by which a job is preempted. This can be checkpointing, suspension, or requeueing.

Preemption target
A preemption target is a job in a specified queue or a job that has requested a specified resource. The queue and/or resource is specified in another job’s Resource_List.preempt_targets.

Pre-execution event hook
A hook that runs before the job is accepted by MoM. These hooks do not run on execution hosts. Pre-execution event hooks are for job submission, moving a job, altering a job, or just before sending a job to an execution host.

Primary Scheduler
The PBS Professional scheduler daemon which is running during normal operation.

Primary Execution Host
The execution host where a job’s top task runs, and where the MoM that manages the job runs.

Primary Server
The PBS Professional server daemon which is running during normal operation.
Chapter 1  

Glossary of Terms

**Project**  
In PBS, a project is a way to group jobs independently of users and groups. A project is a tag that identifies a set of jobs. Each job’s project attribute specifies the job’s project.

**Project limit**  
This is a limit applied to the total used by a project, whether the limit is a generic project limit or an individual project limit.

**Provision**  
To install an OS or application, or to run a script which performs installation and/or setup.

**Provisioned vnode**  
A vnode which, through the process of provisioning, has an OS or application that was installed, or which has had a script run on it.

**Provisioning hook**  
The hook which performs the provisioning, either by calling other scripts or by running commands.

**Provisioning tool**  
A tool that performs the actual provisioning, e.g. SGI Tempo.

**Pulling queue**  
In peer scheduling, the queue into which jobs are pulled, and from which they are run.

**Queue**  
A queue is a named container for jobs at a server. There are two types of queues in PBS: routing queues and execution queues. A routing queue is a queue used to move jobs to other queues including those that exist on other PBS servers. A job must reside in an execution queue to be eligible to run and remains in an execution queue during the time it is running. In spite of the name, jobs in a queue need not be processed in queue order (first-come first-served or FIFO).

**Queuing**  
The collecting together of work or tasks to be run on a computer. Users submit tasks or “jobs” to the resource management system where they are queued up until the system is ready to run them.

**Redundant License Server Configuration**  
Allows licenses to continue to be available should one or more license servers fail. There are two types: 1) license server list configuration, and 2) three-server configuration.
Glossary of Terms

Reject an action (Hooks)
An action is rejected when a hook prevents the action from taking place.

Requeue
The process of stopping a running job and putting it back into the queued (“Q”) state.

Rerunnable
If a running PBS job can be terminated and then restarted from the beginning without harmful side effects, the job is rerunnable. The job’s Rerunnable attribute must be set to y in order for PBS to consider a job to be rerunnable.

Reservation Degradation
PBS attempts to ensure that reservations run by finding usable vnodes when reservation vnodes become unavailable.

Resource
A resource can be something used by a job, such as CPUs, memory, high-speed switches, scratch space, licenses, or time, or it can be an arbitrary item defined for another purpose. PBS has built-in resources, and allows custom-defined resources. See "PBS Resources" on page 305 in the PBS Professional Administrator’s Guide.

Restart
A job that was stopped after being checkpointed while previously executing is executed again, starting from the point where it was checkpointed.

Restart File
The job-specific file that is written by the checkpoint script or tool. This file contains any information needed to restart the job from where it was when it was checkpointed.

Restart Script
The script that MoM runs to restart a job. This script is common to all jobs, and so must use the information in a job’s restart file to restart the job.

Route a job
When PBS moves a job between queues. PBS provides a mechanism whereby a job is automatically moved from a routing queue to another queue. This is performed by PBS. The resource request for each job in a routing queue is examined, and the job is placed in a destination queue which matches the resource request. The destination queue can be an execution queue or another routing queue.

Routing queue
A queue that serves as a temporary holding place for jobs, before they are moved to another queue. Jobs cannot run from routing queues.
Scheduler
The scheduler is the daemon which implements the site’s job scheduling policy controlling when and where each job is run. The scheduler is the process called pbs_sched.

Scheduling
The process of selecting which jobs to run when and where, according to a predetermined policy. Sites balance competing needs and goals on the system(s) to maximize efficient use of resources (both computer time and people time).

Scheduling policy
Scheduling policy determines when each job runs, and how much of each resource it can use. Scheduling policy consists of a system for determining the priority of each job, combined with a set of limits on how many jobs can be run, and/or how much of each resource can be used.

Schema Admins (Windows)
A group that exists only in the root domain of an Active Directory forest of domains. The group is authorized to make schema changes in Active Directory.

Secondary Scheduler
The PBS Professional scheduler daemon which takes over when the primary scheduler is not available.

Secondary Server
The PBS Professional server daemon which takes over when the primary server fails.

Sequence_number
The numeric part of a job or job array identifier, e.g. 1234.

Server
The central PBS daemon, which does the following:
- Handles PBS commands
- Receives and creates batch jobs
- Sends jobs for execution
The server is the process called pbs_server.
Each PBS complex has one primary server, and if the complex is configured for failover, a secondary server.
The server contains a licensing client which communicates with the licensing server for licensing PBS jobs.

Shared resource
A vnode resource defined and managed at one vnode, but available for use at others.
Shrink-to-fit job
A job that requests the `min_walltime` resource. A shrink-to-fit job requests a running
time in a specified range, where `min_walltime` is required, and `max_walltime` is not.
PBS computes the actual `walltime`.

Sister
Any MoM that is not on the head or first host of a multihost job. A sister is directed
by the Mother Superior. Also called a `subordinate MoM`.

Sisterhood
All of the MoMs involved in running a particular job.

Snapshot Checkpoint
The checkpoint script or tool writes a restart file, and the job continues to execute.
The job resumes from this start file if the system experiences a problem during the
job’s subsequent execution.

Soonest occurrence of a standing reservation
The occurrence which is currently active, or if none is active, then it is the next
occurrence.

Stage in
The process of moving one or more job-related files from a storage location to the
execution host before running the job.

Stage out
The process of moving one or more job-related files from the execution host to a
storage location after running the job.

Staging and execution directory
The staging and execution directory is a directory on the execution host where the
following happens:

- Files are staged into this directory before execution
- The job runs in this directory
- Files are staged out from this directory after execution

A job-specific staging and execution directory can be created for each job, or PBS
can use a specified directory, or a default directory. See "Staging and Execution
Directories for Job" on page 990 in the PBS Professional Administrator’s Guide.

Standing reservation
An advance reservation which recurs at specified times. For example, the user can
reserve 8 CPUs and 10GB every Wednesday and Thursday from 5pm to 8pm, for the
next three months.
Chapter 1  Glossary of Terms

State
The PBS server, vnodes, reservations, and jobs can be in various states, depending on what PBS is doing. For example the server can be idle or scheduling, vnodes can be busy or free, and jobs can be queued or running, among other states. For a complete description of states, see "States" on page 429.

Strict ordering
A scheduling policy where jobs are run according to policy order. If the site-specified policy dictates a particular priority ordering for jobs, that is the order in which they are run. Strict ordering can be modified by backfilling in order to increase throughput. See "Backfilling".

Subject
A process belonging to a job run by an authorized, unprivileged user (a job submitter.)

Subjob
One of the jobs in a job array, e.g. 1234[7], where 1234 [ ] is the job array itself, and 7 is the index. Queued subjobs are not individually listed in the queue; only their job array is listed. Running subjobs are individually listed.

Subjob index
The unique index which differentiates one subjob from another. This must be a non-negative integer.

Subordinate MoM
Any MoM that is not on the head or first host of a multihost job. A subordinate MoM is directed by the Mother Superior. Also called a sister.

Task
A process belonging to a job. A POSIX session started by MoM on behalf of a job.

Task placement
The process of choosing a set of vnodes to allocate to a job that will both satisfy the job's resource request (select and place specifications) and satisfy the configured scheduling policy.

Three-server Configuration
One form of redundant license server configuration. Means that if any 2 of the 3 license servers are up and running (referred to as a quorum), the system is functional, with 1 server acting as master who can issue licenses. If the master goes down, then
another server must take over as master. This is set up as a license file on each of the
3 redundant servers containing:
SERVER <server1> ... <port1>
SERVER <server2> ... <port2>
SERVER <server3> ... <port3>
PBS Professional can point to a license server host that has

**Token**
Also called “GridWorks Unit”, a unit of value which is checked out from the license
server. The number of PBS tokens will be related to the number of CPUs requested
by a job that is being executed.

**TPP**

**User**
Has two meanings:
1. A person who submits jobs to PBS, as differentiated from Operators, Managers
   and administrators. See "User" on page 789 in the PBS Professional Adminis-
   trator’s Guide.
2. A system user, identified by a unique character string (the user name) and by a
   unique number (the user ID). Any person using the system has a username and
   user ID.

**User access, Access by user**
The specified user is allowed access at the server, queues, and reservations.

**User ID, UID**
A unique numeric identifier assigned to each user.

**User limit**
Refers to configurable limits on resources and jobs. A limit placed on one or more
users, whether generic or individual.

**vchunk**
The part of a chunk that is supplied by one vnode. If a chunk is broken up across
multiple vnodes, each vnode supplies a vchunk.

**Version 1 configuration file**
MoM configuration file containing MoM configuration parameters. See Chapter 3,
"MoM Parameters", on page 283.
Chapter 1

Glossary of Terms

Version 2 configuration file
Also called vnodedefs file. Vnode configuration file containing vnode attribute settings. Created using pbs_mom -s insert command.

Virtual processor, VP
PBS can treat a vnode as if it has more processors available than the number of physical processors. When resources_available.ncpus is set to a number higher than the actual number of physical processors, the vnode can be said to have virtual processors. Also called logical processors.

Vnode
A virtual node, or vnode, is an abstract object representing a set of resources which form a usable part of an execution host. This could be an entire host, or a nodeboard or a blade. A single host can be made up of multiple vnodes. Each vnode can be managed and scheduled independently. Each vnode in a complex must have a unique name. Vnodes can share resources, such as node-locked licenses.

vnodedefs file
This chapter contains a description of each PBS command. Each description includes any options to the command.

2.1 Windows Requirements

Under Windows, use double quotes when specifying arguments to PBS commands.

2.2 Requirements for Commands

Some PBS commands require root privilege or PBS Operator or Manager privilege in order to run. Some can be executed by anyone, but the output depends upon the privilege of the user. Most PBS commands require that the server be running; some require that MoMs be running. The following table lists the commands, and indicates the permissions required to use each, and whether the server or MoM must be running.

Table 2-1: Permission and Daemon Requirements for Commands

2.3 mpiexec

Runs MPI programs under PBS on Linux

2.3.1 Synopsis

mpixec

mpixec --version
2.3.2 Description

The PBS mpiexec command provides the standard mpiexec interface on an SGI Altix, ICE or UV running supported versions of ProPack or Performance Suite. If executed on a non-Altix, non-ICE, and non-UV system, it will assume it was invoked by mistake. In this case it will use the value of PBS_O_PATH to search for the correct mpiexec. If one is found, the PBS mpiexec will exec it.

The PBS mpiexec calls the SGI mpirun(1). The name of the array to use when invoking mpirun is user-specifiable via the PBS_MPI_SGIARRAY environment variable.

It is transparent to the user; MPI jobs submitted outside of PBS will run as they would normally. MPI jobs can be launched across multiple SGI machines. PBS will manage, track, and cleanly terminate multi-host MPI jobs. PBS users can run MPI jobs within specific partitions. If the PBS_MPI_DEBUG environment variable’s value has a nonzero length, PBS will write debugging information to standard output.

2.3.3 Usage

The PBS mpiexec command presents the mpiexec interface described in section “4.1 Portable MPI Process Startup” of the “MPI-2: Extensions to the Message-Passing Interface” document in http://www.mpiforum.org/docs/mpi-20-html/node42.htm

2.3.4 Options

--version
    The mpiexec command returns its PBS version information and exits. This option can only be used alone.

2.3.5 Requirements

Altix, ICE, or UV running a supported version of ProPack or Performance Suite.

PBS uses SGI’s mpirun(1) command to launch MPI jobs. SGI’s mpirun must be in the standard location.

The location of pbs_attach() on each node of a multinode MPI job must be the same as it is on the mother superior node.
In order to run multihost jobs, the SGI Array Services must be correctly configured. SGI systems communicating via SGI’s Array Services must all use the same version of the sgi-arraysvc package. SGI systems communicating via SGI’s Array Services must have been configured to interoperate with each other using the default array. See SGI’s array_services(5) man page.

### 2.3.6 Environment Variables

The PBS mpiexec script sets the PBS_CPUSET_DEDICATED environment variable to assert exclusive use of the resources in the assigned cpuset.

The PBS mpiexec checks the PBS_MPI_DEBUG environment variable. If this variable has a nonzero length, debugging information is written.

If the PBS_MPI_SGIARRAY environment variable is present, the PBS mpiexec will use its value as the name of the array to use when invoking mpirun.

The PBS_ENVIRONMENT environment variable is used to determine whether mpiexec is being called from within a PBS job.

The PBS mpiexec uses the value of PBS_O_PATH to search for the correct mpiexec if it was invoked by mistake.

### 2.3.7 Path

PBS’ mpiexec is located in PBS_EXEC/bin/mpiexec.

### 2.3.8 See Also

PBS man pages: pbs_attach(8B)

### 2.4 nqs2pbs

Converts NQS job scripts to PBS format.
2.4.1 Synopsis

nqs2pbs nqs_script [pbs_script]
nqs2pbs --version

2.4.2 Description

This utility converts an existing NQS job script to work with PBS and NQS. The existing script is copied and PBS directives, #PBS, are inserted prior to each NQS directive #QSUB or #@$, in the original script.

Certain NQS date specification and options are not supported by PBS. A warning message will be displayed indicating the problem and the line of the script on which it occurred.

If any unrecognizable NQS directives are encountered, an error message is displayed. The new PBS script will be deleted if any errors occur.

2.4.3 Options

--version
   The nqs2pbs command returns its PBS version information and exits. This option must be used alone.

2.4.4 Operands

nqs_script
   Specifies the file name of the NQS script to convert. This file is not changed.

pbs_script
   If specified, it is the name of the new PBS script. If not specified, the new file name is nqs_script.new.

NOTES

Converting NQS date specifications to the PBS form may result in a warning message and an incompletely converted date. PBS does not support date specifications of “today”, “tomorrow”, or the name of the days of the week such as “Monday”. If any of these are encountered in a script, the PBS specification will contain only the time portion of the NQS specification, i.e. #PBS -a hhmm[.ss]. It is suggested that you specify the execution time on the qsub command line rather than in the script.
Note that PBS will interpret a time specification without a date in the following way:

- If the time specified has not yet been reached, the job will become eligible to run at that time today.
- If the specified time has already passed when the job is submitted, the job will become eligible to run at that time tomorrow.

This command does not support time zone identifiers. All times are taken as local time.

### 2.4.5 See Also

qsub(1B)

### 2.5 pbs-report

Prints PBS job statistics.

#### 2.5.1 Synopsis

```
pbs-report [--age seconds[:offset]] [--account account] [--begin -b yyyyymmdd[:hhmm[ss]]]
  [--end -e yyyyymmdd[:hhmm[ss]]] [--exit -x integer] [--explainwait] [--group UNIX group]
  [--package solver] [--point yyyyymmdd[:hhmm[ss]]] [--queue PBS queue]
  seconds] [--wallmin seconds]
```

```
pbs-report --version
```

#### 2.5.2 Description

Allows the PBS Administrator to generate a report of job statistics from the PBS accounting logfiles. Options to the `pbs-report` command control how jobs are selected for reporting and how reports are generated.

The `pbs-report` command is not available on Windows.

Before first using `pbs-report`, the Administrator is advised to tune the configuration to match the local site by editing the file PBS_EXEC/lib/pm/PBS.pm.
Chapter 2  

PBS Commands

2.5.2.1  Permissions

This command can be run only by root.

2.5.2.2  Selecting Jobs For Reporting

2.5.2.2.i  Filtering Jobs by Dates or Times

--begin, --end, --range, --age, --point

--begin and --end

Work from hard date limits. Omitting either will cause the report to contain all data
to either the beginning or the end of the accounting data. Unbounded date reports
may take several minutes to run, depending on the volume of work logged.

Jobs are listed by start time only, regardless of whether end time is specified via --
end or --inclusive.

--range

A short-hand way of selecting a prior date range and will supersede --begin and --
end.

--age

Allows the user to select an arbitrary period going back a specified number of sec-
onds from the time the report is run. --age will silently supersede all other date
options.

--point

Displays all jobs which were running at the specified point in time, and is incompat-
ible with the other options. --point will produce an error if specified with any other
date-related option.

2.5.2.2.ii  Filtering Jobs by Attribute

--cpumax, --cpumin, --waitmax, --waitmin, --wallmax, --wallmin

A maximum value will cause any jobs with more than the specified amount to be
ignored. A minimum value will cause any jobs with less than the specified amount
to be ignored. All six options may be combined, though doing so will often restrict
the filter such that no jobs can meet the requested criteria. Combine time filters for
different time with caution.

2.5.2.2.iii  Filtering Jobs by User or Department

--dept, --group, --user
--dept
Allows for integration with an LDAP server and will generate reports based on department codes as queried from that server. If no LDAP server is available, department-based filtering and sorting will not function.

--group
Allows for filtering of jobs by primary group ownership of the submitting user, as defined by the operating system on which the PBS server runs.

--user
Allows for explicit naming of users to be included.
It is possible to specify a list of values for these filters, by providing a single colon-concatenated argument or using the option multiple times, each with a single value.

2.5.2.2.iv Filtering Jobs by Job Property
--host, --exit, --package, --queue

--host
Allows for filtering of jobs based on the host on which the job was executed.

--exit
Allows for filtering of jobs based on the job exit code.

--package
Allows for filtering of jobs based on the software package used in the job. This option will only function when a package-specific custom resource is defined for the PBS server and requested by the jobs as they are submitted.

--queue
Allows for filtering of jobs based on the queue in which the job finally executed. With the exception of --exit, it is possible to specify a list of values for these filters, by providing a single colon-concatenated argument or using the option multiple times, each with a single value.

2.5.2.2.v Filtering Jobs by Account String
--account
This option allows the user to filter jobs based on an arbitrary, user-specified job account string. The content and format of these strings is site-defined and unrestricted; it may be used by a custom job front-end which enforces permissible account strings, which are passed to qsub with qsub’s -A option.

2.5.2.2.vi Negating Filters
--negate
The --negate option allows for logical negation of one or more specified filters. Only the account, dept, exit, group, host, package, queue, and user filters may be
negated. If a user is specified with --user, and the ‘--negate user’ option is used, only jobs not belonging to that user will be included in the report. Multiple report filters may be negated by providing a single colon-concatenated argument or using -negate multiple times, each with a single value.

2.5.2.3 Generating Reports

Several report types can be generated, each indexed and sorted according to the user’s needs.

--verbose
Generates a wide tabular output with detail for every job selected. It can be used to generate output for import to a spreadsheet. Verbose reports may be sorted on any field using the --vsort option. Default: summary report only.

--reslist
Generates a tabular output with detail on resources requested for every job selected. Resource list reports may be sorted on any field using the --vsort option. Default: summary report only.

--inclusive
Allows a user to require that the job’s start time also falls within the date range. Jobs are listed by start time only, regardless of whether end time is specified via --end or --inclusive.

--index
Allows specification of the field on which data in the summary should be grouped. Fields listed in the option description are mutually exclusive. The selected field will be the left-most column of the summary report output. One value may be selected as an index while another is selected for sorting. However, since index values are mutually exclusive, the only sort options which may be used (other than the index itself) are account, cpu, jobs, suspend, wait, and wall. If no sort order is selected, the index is used as the sort key for the summary.

--sort
Allows the user to specify a field on which to sort the summary report. It operates independently of the sort field for verbose reports (see --vsort). See the description for --index for how the two options interact.

--vsort
Allows the user to specify a field on which to sort the verbose report. It operates independently of the sort field for summary reports (see --sort).
2.5.3 Options to pbs-report

--age -a seconds[:offset]
Report age in seconds. If an offset is specified, the age range is taken from that offset backward in time, otherwise a zero offset is assumed. The time span is from (now - age - offset) to (now - offset). This option silently supersedes --begin, --end, and --range.

--account account
Limit results to those jobs with the specified account string. Multiple values may be concatenated with colons or specified with multiple instances of --account.

--begin -b yyyymmdd[:hhmm[ss]]
Report begin date and optional time. Default: most recent log data. --begin and --end work from hard date limits. Omitting either will cause the report to contain all data to either the beginning or the end of the accounting data. Unbounded date reports may take several minutes to run, depending on the volume of work logged.

Jobs are listed by start time only, regardless of whether end time is specified via --end or --inclusive.

--count -c
Display a numeric count of matching jobs. Currently only valid with --cpumax for use in monitoring rapidly-exiting jobs.

--cpumax seconds
Filter out any jobs which have more than the specified number of CPU seconds.

--cpumin seconds
Filter out any jobs which have less than the specified number of CPU seconds.

--dept -d department
Limit results to those jobs whose owners are in the indicated department. Default: any. This option only works in conjunction with an LDAP server which supplies department codes. See also the --group option. Multiple values may be concatenated with colons or specified with multiple instances of --dept.

--end -e yyyymmdd[:hhmm[ss]]
Report end date and optional time. Default: most recent log data. --begin and --end work from hard date limits. Omitting either will cause the report to contain all data to either the beginning or the end of the accounting data. Unbounded date reports may take several minutes to run, depending on the volume of work logged.

Jobs are listed by start time only, regardless of whether end time is specified via --end or --inclusive.

--exit -x integer
Limit results to jobs with the specified exit status. Default: any.
Chapter 2

PBS Commands

--explainwait
Print a reason for why jobs had to wait before running.

--group -g group
Limit results to the specified group name. Group is defined by the operating system.
Multiple values may be concatenated with colons or specified with multiple
instances of --group.

--help -h
Prints a brief help message and exits.

--host -m execution host
Limit results to the specified execution host. Multiple values may be concatenated
with colons or specified with multiple instances of --host.

--inclusive key
Limit results to jobs which had start times in the range.
Jobs are listed by start time only, regardless of whether end time is specified via --end or --inclusive.

--index -i key
Field on which to index the summary report. Default: user. Valid values include:
date, dept, host, package, queue, user.

--man
Prints the manual page and exits.

--negate -n option
Logically negate the selected options; print all records except those that match the
values for the selected criteria. Default: unset. Valid values: account, dept, exit,
group, host, package, queue, user. Defaults cannot be negated, only options
explicitly specified are negated. Multiple values may be concatenated with colons or
specified with multiple instances of --negate.

--package -p package
Limit results to the specified software package. Multiple values may be concate-
nated with colons or specified with multiple instances of --package. Valid values
are can be seen by running a report with the --index package option. This option
keys on custom resources requested at job submission time. Sites not using such
custom resources will have all jobs reported under the catchall None package with
this option.

--point yyyymmddd[:hhmm[ss]]
Print a report of all jobs which were actively running at the point in time specified.
This option cannot be used with any other date or age option.
--queue -q queue
Limit results to the specified queue. Multiple values may be concatenated with colons or specified with multiple instances of --queue. Note that if specific queues are defined via the @QUEUES line in PBS.pm, then only those queues will be displayed. Leaving that parameter blank allows all queues to be displayed.

--range -r period
Time period used is period before now. For example, if the period given is “week”, pbs-report looks at all jobs which have finished and which were running any time from a week ago to now. Default: all. Valid values for period are today, week, month, quarter, and year. This option silently supersedes --begin and --end, and is superseded by --age.

--reslist
Include resource requests for all matching jobs. This option is mutually exclusive with --verbose.

--sched -t
Generate a brief statistical analysis of Scheduler cycle times. No other data on jobs is reported.

--sort -s field
Field by which to sort reports. Default: user. Valid values are cpu, date, dept, host, jobs, package, queue, suspend (aka muda), wait, and wall.

--time option
Valid values: “full”, “partial”. Used to indicate how time should be accounted. The default of “full” means that entire job’s CPU and wall time is counted in the report if the job ended during the report’s date range. With the “partial” option, only CPU and wall time during the report’s date range are counted.

By default, time is credited at the point when the job ended. This can be changed using the --inclusive option. For a job which ended a few seconds after the report range begins, this can cause significant overlap, which may boost results. During a sufficiently large time frame, this overlap effect is negligible and may be ignored. This value for --time should be used when generating monthly usage reports. With “partial”, any CPU or wall time accumulated prior to the beginning of the report is ignored. “partial” is intended to allow for more accurate calculation of overall cluster efficiency during short time spans during which a significant overlap effect can skew results. See --inclusive.

--user -u username
Limit results to the specified username. Multiple values may be concatenated with colons or specified with multiple instances of --user.
Chapter 2  

PBS Commands

--verbose -v  
Include attributes for reported jobs. Subjobs are shown, but not job arrays. Default: no attributes.

--version  
The pbs-report command returns its PBS version information and exits. This option can only be used alone.

--vsort field  
Field by which to sort the verbose output section reports. Default: jobid. Valid values are cpu, date, exit, host, jobid, jobname, mem, name, package, queue, scratch, suspend, user, vmem, wall, wait. If neither --verbose nor --reslist is specified, --vsort is silently ignored. The scratch sort option is available only for resource reports (--reslist).

--waitmax seconds  
Filter out any jobs which have more than the specified wait time in seconds.

--waitmin seconds  
Filter out any jobs which have less than the specified wait time in seconds.

--wallmax seconds  
Filter out any jobs which have more than the specified wall time in seconds.

--wallmin seconds  
Filter out any jobs which have less than the specified wall time in seconds.

--wall -w  
Use the walltime resource attribute rather than wall time calculated by subtracting the job start time from end time. The walltime resource attribute does not accumulate when a job is suspended for any reason, and thus may not accurately reflect the local interpretation of wall time.

2.5.4 Examples

“How much in the way of resources did every job this month waiting more than 10 minutes request?”

`pbs-report --range month --waitmin 600 --reslist`

This information might be valuable to determine if some simple resource additions (e.g. more memory or more disk) might increase overall throughput of the cluster.
2.5.4.1 Statistical Analysis

At the bottom of the summary statistics, prior to the job set summary, is a statistical breakdown of the values in each column. Example:

<table>
<thead>
<tr>
<th>Date</th>
<th># of jobs</th>
<th>Total CPU Time</th>
<th>Total Wall Time</th>
<th>Efcy.</th>
<th>Average Wait Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL</td>
<td>1900</td>
<td>10482613</td>
<td>17636290</td>
<td>0.594</td>
<td>1270</td>
</tr>
<tr>
<td>Minimum</td>
<td>4</td>
<td>4715</td>
<td>13276</td>
<td>0.054</td>
<td>221</td>
</tr>
<tr>
<td>Maximum</td>
<td>162</td>
<td>1399894</td>
<td>2370006</td>
<td>1.782</td>
<td>49284</td>
</tr>
<tr>
<td>Mean</td>
<td>76</td>
<td>419304</td>
<td>705451</td>
<td>0.645</td>
<td>2943</td>
</tr>
<tr>
<td>Deviation</td>
<td>41</td>
<td>369271</td>
<td>616196</td>
<td>0.408</td>
<td>9606</td>
</tr>
<tr>
<td>Median</td>
<td>80</td>
<td>242685</td>
<td>436724</td>
<td>0.556</td>
<td>465</td>
</tr>
</tbody>
</table>

This summary should be read in column format. The values each represent a statistical data point in the column. For instance, while the minimum number of jobs run in one day was 4 and the maximum 162, these values do not correlate to the 4715 and 1399894 CPU seconds listed as minima and maxima.

In the Job Set Summary section, the values should be read in rows, as shown here:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Minimum</th>
<th>Maximum</th>
<th>Mean</th>
<th>Deviation</th>
<th>Median</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU time</td>
<td>0</td>
<td>18730</td>
<td>343</td>
<td>812</td>
<td>0</td>
</tr>
<tr>
<td>Wall time</td>
<td>0</td>
<td>208190</td>
<td>8496</td>
<td>19711</td>
<td>93</td>
</tr>
<tr>
<td>Wait time</td>
<td>0</td>
<td>266822</td>
<td>4129</td>
<td>9018</td>
<td>3</td>
</tr>
</tbody>
</table>

These values represent aggregate statistical analysis for the entire set of jobs included in the report. The values in the prior summary represent values over the set of totals based on the summary index (e.g. Maximum and Minimum are the maximum and minimum totals for a given day/user/department, rather than an individual job. The job set summary represents an analysis of all individual jobs.
2.5.4.2 Cluster Monitoring

The --count and --cpumax functions are intended to allow an administrator to periodically run this script to monitor for jobs which are exiting rapidly, representing a potential global error condition causing all jobs to fail. It is most useful in conjunction with --age, which allows a report to span an arbitrary number of seconds backward in time from the current moment. A typical set of options would be "--count --cpumax 30 --age 21600", which would show a total number of jobs which consumed less than 30 seconds of CPU time within the last six hours.

2.5.5 Standard Error

The pbs-report command will write a diagnostic message to standard error for each error occurrence.

2.5.6 Exit Status

Zero upon successful processing of all operands.
Greater than zero if the pbs-report command fails to process any operand.

2.5.7 See Also

2.6 pbs_account

Manage PBS service account

2.6.1 Synopsis

2.6.2 Description

The `pbs_account` command is used to manage the PBS service account. It is used to create the account, set or validate the account password, add privileges to the account, and register or unregister the account with the SCM.

2.6.3 Permissions

This command can be run by administrators only.

2.6.4 Platforms

This command is available on Windows only.

2.6.5 Options

- `-a <account name>`
  Specifies account name.

- `-c [<password>]`
  • If specified account does not exist, creates the account with the password.
  • If specified account exists, validates password against it.
  If password is not specified, user is prompted for password.

- `-o <output path>`
  Prints `stdout` and `stderr` messages in specified output path

- `-p [<password>]`
  Updates the PBS service account password. If no password is specified, the user is prompted for a password.

- `-s`
  Adds necessary privileges to the PBS service account. Grants the "Create Token Object", "Replace Process Level Token", "Log On as a Service", and "Act as Part of the Operating System" privileges to PBS service account.

- `--reg-server <path to server> [password]`

- `--reg-mom <path to MoM> [password]`

- `--reg-sched <path to scheduler> [password]`

- `--reg-rshd <path to rshd> [password]`
  Registers the PBS service with the SCM, instructing it to run the services under the PBS service account and supplied password. `<path>` must be in double quotes.
Chapter 2  

**PBS Commands**

```
--unreg-server <path to server>
--unreg-mom <path to MoM>
--unreg-sched <path to scheduler>
--unreg-rshd <path to rshd>

Unregisters the PBS service with the SCM. <path> must be in double quotes.
```

```
--ci

Prints actions taken by pbs_account while creating PBS service account when -c option is used

<no options>

Prints name of PBS service account, if it exists. Exit value is 0.
```

### 2.6.6 Examples

Example 2-1: To create the PBS service account:

```
pbs_account -c -s -p password
```

Example 2-2: To change the PBS service account:

```
pbs_account [--reg service_path] [- a PBS service account name]
```

Example 2-3: To register the server, scheduler, MoM, and rshd services:

```
pbs_account --reg "\Program Files\PBS Pro\exec\sbin\pbs_server.exe" [-p <password>]
pbs_account --reg "\Program Files\PBS Pro\exec\sbin\pbs_mom.exe" [-p <password>]
pbs_account --reg "\Program Files\PBS Pro\exec\sbin\pbs_sched.exe" [-p <password>]
pbs_account --reg "\Program Files\PBS Pro\exec\sbin\pbs_rshd.exe" [-p <password>]
```

### 2.7 pbs_attach

Attaches a session ID to a PBS job
2.7.1 Synopsis

Linux/UNIX

```
pbs_attach [-j jobid] [-m port] -p pid
pbs_attach [-j jobid] [-m port] [-P] [-s] cmd [arg ...]
pbs_attach --version
```

Windows

```
pbs_attach [-c <path to script>] [-j jobid] [-m port] -p pid
pbs_attach [-c <path to script>] [-j jobid] [-m port] [-P] [-s] cmd [arg ...]
pbs_attach --version
```

2.7.2 Description

The `pbs_attach` command associates the processes in a session with a PBS job by attaching the session ID to the job. This allows PBS MoM to monitor and control those processes. MoM uses process IDs to determine session IDs, which are put into MoM’s task list (attached to the job.) All process IDs in a session are then associated with the job.

When a command `cmd` is given as an operand, the `pbs_attach` process becomes the parent process of `cmd`, and the session ID of `pbs_attach` is attached to the job.

The `-p` option cannot be used with the `-P` or `-s` options or the `cmd` operand.

2.7.3 Options to `pbs_attach`

- `-c <path to script>`
  - Windows only. Specified command is invoked using a new command shell. In order to spawn and attach built-in DOS commands such as `set` or `echo`, it is necessary to open the task using a `cmd` shell. The new command shell, `cmd.exe`, is attached as a task to the PBS job. The `pbs_attach` command spawns a program using a new command shell when attaching a batch script, or when invoked with the `-c` option.

- `-j jobid`
  - The job ID to which the session ID is to be attached. If `jobid` is not specified, a best effort will be made to determine the job to which to attach the session.

- `-m port`
  - The port at which to contact MoM. Default: value of `PBS_MANAGER_SERVICE_PORT` from `pbs.conf`
2.7.4 Operands

cmd
Name of command whose process ID is to be associated with the job.

2.7.5 Exit Status

0
Success

1
Any error following successful command line processing. A message is printed to standard error.

If cmd is specified, pbs_attach waits for cmd to exit, then exits with the exit value of cmd.

If cmd is not specified, pbs_attach exits after attaching the session ID(s) to the job.

2.7.6 See Also

The PBS Professional Administrator's Guide, pbs_mom(8B), pbs_tmrsh(8B), tm(3)
2.8  **pbs_comm**

Starts the PBS communication daemon

### 2.8.1  Synopsis

**UNIX/Linux:**

```
pbs_comm [-N] [-r <other routers>] [-t <number of threads>]
```

```
pbs_comm --version
```

**Windows:**

```
pbs_comm.exe [-R|-U|-N] [-r <other routers>] [-t <number of threads>]
```

```
pbs_comm --version
```

### 2.8.2  Description

The PBS communication daemon, *pbs_comm*, handles communication between daemons, except for scheduler-server and server-server communication, which uses TCP. The server, scheduler, and MoMs are connected by one or more *pbs_comm* daemons.

See “Communication” on page 87 in the PBS Professional Installation & Upgrade Guide.

### 2.8.3  Options to pbs_comm

- **-N**
  
  Runs the communication daemon in standalone mode.

- **-r**
  
  Used to specify the list of other *pbs_comm* daemons to which this *pbs_comm* must connect. This is equivalent to the *pbs.conf* variable PBS_COMM_ROUTERS. The command line overrides the variable. Format:

  ```
  <host>[:<port>],[<host>[:<port>]]
  ```

- **-R**
  
  Registers the *pbs_comm* process. Available under Windows only.

- **-t**
  
  Used to specify the number of threads the *pbs_comm* daemon uses. This is equivalent to the *pbs.conf* variable PBS_COMM_THREADS. The command line overrides the variable. Format:
Chapter 2  PBS Commands

Integer

-U
Unregisters the pbs_comm process. Available under Windows only.

2.8.4 Configuration Parameters

PBS_LEAF_ROUTERS
Parameter in /etc/pbs.conf. Tells an endpoint where to find its communication daemon.

You can tell each endpoint which communication daemon it should talk to. Specifying the port is optional.

Format: PBS_LEAF_ROUTERS=<host>[:<port>][,<host>[:<port>]]

PBS_COMM_ROUTERS
Parameter in /etc/pbs.conf. Tells a pbs_comm where to find its fellow communication daemons.

When you add a communication daemon, you must tell it about the other pbs_comm in the complex. When you inform communication daemons about each other, you only tell one of each pair about the other. Do not tell both about each other. We recommend that an easy way to do this is to tell each new pbs_comm about each existing pbs_comm, and leave it at that.

Format: PBS_COMM_ROUTERS=<host>[:<port>][,<host>[:<port>]]

PBS_COMM_THREADS
Parameter in /etc/pbs.conf. Tells pbs_comm how many threads to start.

By default, each pbs_comm process starts four threads. You can configure the number of threads that each pbs_comm uses. Usually, you want no more threads than the number of processors on the host.

Maximum allowed value: 100

Format: Integer

Example:

PBS_COMM_THREADS=8
PBS Commands

2.8.5 Communication Daemon Logfiles

The pbs_comm daemon creates its log files under $PBS_HOME/comm_logs. This directory is automatically created by the PBS installer.

In a failover configuration, this directory is in the shared PBS_HOME, and is used by the pbs_comm daemons running on both the primary and secondary servers. This directory must never be shared across multiple pbs_comm daemons in any other case.
Chapter 2  
PBS Commands  

The log filename format is *yyyymmdd* (the same as for other PBS daemons).

The log record format is the same as used by other pbs daemons, with the addition of the thread number and the daemon name in the log record. The log record format is as follows:

```
date-time;event_code;daemon_name(thread number);object_type;object_name;message
```

Example:

```
03/25/2014 15:13:39;0d86;host1.example.com;TPP:host1.example.com(Thread 2);Connection from leaf 192.168.184.156:19331, tfd=81 down
```

### 2.8.6 Signal Handling by Communication Daemon

The `pbs_comm` daemon handles the following signals:

- **HUP**
  
  Re-reads the value of `PBS_COMM_LOGMASK` from `pbs.conf`.

- **TERM**
  
  The `pbs_comm` daemon exits.

### 2.9 pbs_dataservice

Start, stop, or check the status of PBS data service

#### 2.9.1 Synopsis

`pbs_dataservice [start|stop|status]`

#### 2.9.2 Description

The `pbs_dataservice` command starts, stops or gets the status of the PBS data service.

#### 2.9.3 Permission

On UNIX, root privilege is required to use this command. On Windows, Admin privilege is required.
2.9.4 Arguments

start
  Starts the PBS data service.

stop
  Stops the PBS data service.
  Can be used only when PBS server is not running.

status
  Displays the status of the PBS data service, as follows:
  • Data service running
    PBS Data Service running
  • Data service not running
    PBS Data Service not running

2.9.5 Exit Status

Zero for success
Non-zero for failure

2.10 pbs_ds_password

Sets or changes data service user account or its password

2.10.1 Synopsis

pbs_ds_password [-r] [-C username]

2.10.2 Description

You can use this command to change the user account or account password for the data service. Blank passwords are not allowed.

2.10.3 Permissions

On UNIX, root privilege is required to use this command. On Windows, Admin privilege is required.
2.10.4 Restrictions

Do not run this command if failover is configured. It is important not to inadvertently start two separate instances of the data service on two machines, thus potentially corrupting the database.

2.10.5 Options to pbs_ds_password

-\texttt{C <username>}
  Changes user account for data service to specified account. Specified user account must already exist.
  On UNIX-based systems, the specified user account must not be root.
  On Windows, the specified user account must match the PBS service account (which can be any user account.)
  This option cannot be used while the data service is running.
  Can be used with the -r option to automatically generate a password for the new account.

-\texttt{r}
  Generates a random password. The data service is updated with the new password.
  Can be used with the -C option.

<no option>
  Asks the user to enter a new password twice. Entries must match. Updates data service with new password.

2.10.6 Exit Status

Zero on success.
Non-zero on failure.

2.11 pbs_hostn

Reports hostname and network address(es)
2.11.1 Synopsis

```
pbs_hostn [-v] hostname
pbs_hostn --version
```

2.11.2 Description

The `pbs_hostn` command takes a hostname, and reports the results of both `gethostbyname(3)` and `gethostbyaddr(3)` system calls. Both forward and reverse lookup of hostname and network addresses need to succeed in order for PBS to authenticate a host.

Running this command can assist in troubleshooting problems related to incorrect or non-standard network configuration, especially within clusters.

2.11.3 Options

- `-v`
  
  Turns on verbose mode.

- `--version`
  
  The `pbs_hostn` command returns its PBS version information and exits. This option can only be used alone.

2.11.4 Operands

The `pbs_hostn` command accepts a hostname operand either in short name form, or in fully qualified domain name (FQDN) form.

2.11.5 Standard Error

The `pbs_hostn` command will write a diagnostic message to standard error for each error occurrence.

2.11.6 Exit Status

Zero upon successful processing of all the operands presented to the `pbs_hostn` command.

Greater than zero if the `pbs_hostn` command fails to process any operand.
Chapter 2  
PBS Commands

2.11.7  See Also

pbs_server(8B)

2.12  pbs_idled

PBS daemon to watch the console and inform pbs_mom of idle time

2.12.1  UNIX/Linux Synopsis

pbs_idled [-w wait_time] [-f idle_file] [-D display] [-r reconnect_delay]
pbs_idled --version

2.12.2  Windows Synopsis

pbs_idled [start | stop]
pbs_idled --version

2.12.3  UNIX/Linux Description

On UNIX/Linux, the pbs_idled program sits and watches an X windows display and communicates the idle time of the display back to PBS. If the mouse is moved or a key is touched, PBS is informed that the node is busy.

This program should be run out of the system-wide Xsession file. It should be run in the background before the window manager is run. If this program is run outside of the Xsession, it will need to be able to make a connection to the X display. See the xhost or xauth man pages for a description of X security.

2.12.4  Windows Description

On Windows, pbs_idled reads its polling interval from a file called idle_poll_time which is created by MoM. The process monitors keyboard, mouse, and console activity, and updates a file called idle_touch when it finds user activity. The idle_touch file is created by MoM.
2.12.5 UNIX/Linux Options to pbs_idled

-w <wait_time>
   Granularity between when the daemon checks for events or pointer movement.

-f <idle_file>
   Update file times on <idle_file>. PBS will not monitor any other than the default.

-D <display>
   The display to connect to and monitor.

-r <reconnect_delay>
   The amount of time to try and reconnect to the X display if the previous attempt was unsuccessful.

--version
   The pbs_idled command returns its PBS version information and exits. This option can only be used alone.

2.12.6 Windows Options to pbs_idled

start
   Starts the pbs_idled process.

stop
   Stops the pbs_idled process.

--version
   The pbs_idled process returns its PBS version information and exits. This option can only be used alone.

pbs_mom(8B), xhost(1), xauth(1)

2.13 pbs

Start, stop, restart, or get the PIDs of PBS daemons

2.13.1 Synopsis

pbs [start|stop|restart|status]
Chapter 2  

PBS Commands

2.13.2  Description

The `pbs` command starts, stops or restarts all PBS daemons on the local machine. Does not affect other hosts. It also reports the PIDs of all daemons when given the status argument.

2.13.2.1  Caveats

This command operates only on daemons that are marked as active in `pbs.conf`. For example, if `PBS_START_MOM` is set to 0 in the local `pbs.conf`, this command will not operate on `pbs_mom`, and will not start, stop, or restart `pbs_mom`.

2.13.2.2  Privilege

PBS Manager privilege is required to use this command.

2.13.3  Arguments

- **start**
  Each daemon on the local machine is started. PBS reports the number and type of licenses available, as well as the name of the license server. Any running jobs are killed.

- **stop**
  Each daemon on the local machine is stopped, and its PID is reported.

- **restart**
  All daemons on the local machine are stopped, then they are restarted. PBS reports the name of the license server and the number and type of licenses available.

- **status**
  PBS reports the PID of each daemon on the local machine.

2.13.4  See Also

The PBS Professional Administrator's Guide, `pbs_mom(8B)`, `pbs_server(8B)`, `pbs_sched(3)`

2.14  pbs_interactive

Register, unregister, or get the version of PBS_INTERACTIVE service
# PBS Commands

## 2.14.1 Synopsis

```
pbs_interactive [R | U]
pbs_interactive --version
```

## 2.14.2 Description

The `pbs_interactive` process is used to register or unregister the Windows PBS_INTERACTIVE service. The service must be registered manually; the installer does not register it.

On Windows, the PBS_INTERACTIVE service itself monitors logging in and out by users, starts a `pbs_idled` process for each user logging in, and stops the `pbs_idled` process of each user logging out.

### 2.14.2.1 Privilege

Administrator privilege is required to use this command.

## 2.14.3 Arguments

- **R**
  - Registers the PBS_INTERACTIVE service.
- **U**
  - Unregisters the PBS_INTERACTIVE service.

- **--version**
  - The `pbs_interactive` command returns its PBS version information and exits. This option can only be used alone.

## 2.15 pbs_lamboot

PBS front end to LAM's `lamboot` program

### 2.15.1 Synopsis

```
pbs_lamboot
pbs_lamboot --version
```
2.15.2 Description

The PBS command `pbs_lamboot` replaces the standard `lamboot` command in a PBS
LAM MPI job, for starting LAM software on each of the PBS execution hosts running Linux
2.4 or higher.

Usage is the same as for LAM’s `lamboot`. All arguments except for `bhost` are passed
directly to `lamboot`. PBS will issue a warning saying that the `bhost` argument is ignored by
PBS since input is taken automatically from `$PBS_NODEFILE`. The `pbs_lamboot` pro-
gram will not redundantly consult the `$PBS_NODEFILE` if it has been instructed to boot the
nodes using the `tm` module. This instruction happens when an argument is passed to
`pbs_lamboot` containing “-ssi boot tm” or when the `LAM_MPI_SSI_boot` environment
variable exists with the value `tm`.

2.15.3 Options

`--version`

The `pbs_lamboot` command returns its PBS version information and exits. This
option can only be used alone.

2.15.4 Operands

The operands for `pbs_lamboot` are the same as for `lamboot`.

2.15.5 Environment Variables and Path

The PATH on remote machines must contain `PBS_EXEC/bin`.

2.15.6 See Also

The PBS Professional Administrator's Guide, `lamboot(1)`, `tm(3)`

2.16 `pbs_migrate_users`

Transfers per-user or per-server passwords between PBS servers during a migration upgrade.
2.16.1 Synopsis

`pbs_migrate_users old_server new_server`
`pbs_migrate_users --version`

2.16.2 Description

The `pbs_migrate_users` command is used to transfer the per-user or per-server password of a PBS user from one server to another during a migration upgrade. Users' passwords on the old server are not deleted. Available on Windows and supported Linux x86 and x86_64 platforms only.

2.16.3 Options

   --version
   The `pbs_migrate_users` command returns its PBS version information and exits. This option can only be used alone.

2.16.4 Operands

The format of `old_server` and `new_server` is `hostname[:port_number]`

2.16.5 Exit Status

   0
   Success
   -1
   Writing out passwords to files failed.
   -2
   Communication failure between `old_server` and `new_server`.
   -3
   `Single_signon_password_enable` not set in either `old_server` or `new_server`.
   -4
   User running `pbs_migrate_users` not authorized to migrate users.
2.16.6 See Also

pbs_password(8B)

2.17 pbs_mkdirs

Create, or fix the permissions of, the directories and files used by PBS

2.17.1 Synopsis

pbs_mkdirs
pbs_mkdirs  [ mom | sched | server ]

2.17.2 Description

Runs on Windows only. If the directories and files used by PBS exist, the pbs_mkdirs command fixes their permissions. If the directories and/or files do not exist, the pbs_mkdirs command creates them, with the correct permissions. The pbs_mkdirs command always examines the following directories and files:

- pbs.conf
- PBS_EXEC
- PBS_HOME/spool
- PBS_HOME/undelivered
- PBS_HOME/pbs_environment

2.17.3 Options

mom

The pbs_mkdirs command examines the following additional items:

- PBS_HOME/mom_priv
- PBS_HOME/mom_logs

sched

The pbs_mkdirs command examines the following additional items:

- PBS_HOME/sched_priv
- PBS_HOME/sched_logs
server

The `pbs_mkdirs` command examines the following additional items:

- `PBS_HOME/server_priv`
- `PBS_HOME/server_logs`

(no options)

The `pbs_mkdirs` command examines all of the files and directories specified for each of the `mom`, `server`, and `sched` options.

2.17.4 See Also

The PBS Professional Administrator’s Guide, `pbs_probe(8B)`

2.18 `pbs_mom`

The PBS job monitoring and execution daemon

2.18.1 Synopsis

```
```

`pbs_mom --version`

2.18.2 Description

The `pbs_mom` command starts the PBS job monitoring and execution daemon, called MoM.

The standard MoM starts jobs on the execution host, monitors and reports resource usage, enforces resource usage limits, and notifies the server when the job is finished. The MoM also runs any prologue scripts before the job runs, and runs any epilogue scripts after the job runs.

The MoM performs any communication with job tasks and with other MoMs. The MoM on the first vnode on which a job is running manages communication with the MoMs on the remaining vnodes on which the job runs.

The MoM manages one or more vnodes. PBS may treat a host such as an Altix as a set of virtual nodes, in which case one MoM would manage all of the host’s vnodes. See the PBS Professional Administrator’s Guide.
Chapter 2  PBS Commands

The MoM’s log file is in PBS_HOME/mom_logs. The MoM writes an error message in its log file when it encounters any error. If it cannot write to its log file, it writes to standard error. The MoM will write events to its log file. The MoM writes its PBS version and build information to the log file whenever it starts up or the log file is rolled to a new file.

The executable for pbs_mom is in PBS_EXEC/sbin, and can be run only by root.

2.18.2.1 Cpusets

A cpusetted machine can have a boot cpuset defined by the administrator. A boot cpuset contains one or more CPUs and memory boards and is used to restrict the default placement of system processes, including login. If defined, the boot cpuset will contain CPU 0.

Run parallel jobs exclusively within a cpuset for repeatability of performance. SGI states, “Using cpusets on an Altix system improves cached locality and memory access times and can substantially improve an application’s performance and runtime repeatability.”

The CPUSET_CPU_EXCLUSIVE flag will prevent CPU 0 from being used by the MoM in the creation of job cpusets. This flag is set by default, so this is the default behavior.

To find out which cpuset is assigned to a running job, use qstat -f to see the cpuset field in the job’s altid attribute.

2.18.2.1.i Altix Running Supported Versions of ProPack or Performance Suite

The cpusets created for jobs are marked cpu-exclusive.

MoM does not use any CPU which was in use at startup.

A PBS job can run across multiple Altixes that run supported versions of ProPack or Performance Suite.

PBS can run using SGI’s MPI (MPT) over InfiniBand. See the PBS Professional Administrator’s Guide.

2.18.2.2 Effect on Jobs of Starting MoM

When MoM is started or restarted, her default behavior is to leave any running processes running, but to tell the PBS server to requeue the jobs she manages. MoM tracks the process ID of jobs across restarts.

In order to have all jobs killed and requeued, use the r option when starting or restarting MoM.

In order to leave any running processes running, and not to requeue any jobs, use the p option when starting or restarting MoM.
2.18.3 Options to pbs_mom

-a alarm_timeout
Number of seconds before alarm timeout. Whenever a resource request is processed, an alarm is set for the given amount of time. If the request has not completed before alarm_timeout, the OS generates an alarm signal and sends it to MoM.

Format: Integer
Default: 10 seconds

-C checkpoint_directory
Specifies the path to the directory where MoM creates job-specific subdirectories used to hold each job’s restart files. MoM passes this path to checkpoint and restart scripts. Overrides other checkpoint path specification methods. Any directory specified with the -C option must be owned, readable, writable, and executable by root only (rwx, --, --, or 0700), to protect the security of the restart files. See the -d option to pbs_mom and "Specifying Checkpoint Path" on page 873 in the PBS Professional Administrator’s Guide.

Format: String
Default: PBS_HOME/checkpoint

-c config_file
MoM will read this alternate default configuration file upon starting. If this is a relative file name it will be relative to PBS_HOME/mom_priv. If the specified file cannot be opened, pbs_mom will abort. See the -d option.
MoM’s normal operation, when the -c option is not given, is to attempt to open the default configuration file PBS_HOME/mom_priv/config. If this file is not present, pbs_mom will log the fact and continue.

-d home_directory
Specify the path of the directory to be used in place of PBS_HOME by pbs_mom. The default directory is given by $PBS_HOME.

Format: String

-L logfile
Specifies an absolute path and filename for the log file. The default is a file named for the current date in PBS_HOME/mom_logs/. See the -d option.

Format: string.
Chapter 2  

PBS Commands

-M TCP_port
   Specifies the number of the TCP port on which MoM will listen for server requests and instructions.
   Format: integer port number.
   Default: 15002.

-n nice_val
   Specifies the priority for the pbs_mom daemon.
   Format: integer.

-N
   Specifies that when starting, MoM should not detach from the current session.

-p
   Specifies that when starting, MoM should allow any running jobs to continue running, and not have them requeued. This option can be used for single-host jobs only; multi-host jobs cannot be preserved. Cannot be used with the -r option. MoM is not the parent of these jobs.

Altix running ProPack or Performance Suite
   The cpuset-enabled pbs_mom will, if given the -p flag, use the existing CPU and memory allocations for the /PBSPro cpusets. The default behavior is to remove these cpusets. Should this fail, MoM will exit, asking to be restarted with the -p flag.

-r
   Specifies that when starting, MoM should requeue any rerunnable jobs and kill any non-rerunnable jobs that she was tracking, and mark the jobs as terminated. Cannot be used with the -p option. MoM is not the parent of these jobs.

   It is not recommended to use the -r option after a reboot, because process IDs of new, legitimate tasks may match those MoM was previously tracking. If they match and MoM is started with the -r option, MoM will kill the new tasks.

-R UDP_port
   Specifies the number of the UDP port on which MoM will listen for pings, resource information requests, communication from other MoMs, etc.
   Format: integer port number
   Default: 15003
PBS Commands

Chapter 2

-S server_port
  Specifies the number of the TCP port on which pbs_mom initially contact the server.
  Format: integer port number
  Default: 15001

-s script_options
  This option provides an interface that allows the administrator to add, delete, and display MoM’s configuration files. See CONFIGURATION FILES. script_options are used this way:

  -s insert <scriptname> <inputfile>
    Reads inputfile and inserts its contents in a new site-defined pbs_mom configuration file with the filename scriptname. If a site-defined configuration file with the name scriptname already exists, the operation fails, a diagnostic is presented, and pbs_mom exits with a nonzero status. Scripts whose names begin with the prefix “PBS” are reserved. An attempt to add a script whose name begins with “PBS” will fail. pbs_mom will print a diagnostic message and exit with a nonzero status. Example:
    pbs_mom -s insert <scriptname> <inputfile>

  -s remove <scriptname>
    The configuration file named scriptname is removed if it exists. If the given name does not exist or if an attempt is made to remove a script with the reserved “PBS” prefix, the operation fails, a diagnostic is presented, and pbs_mom exits with a nonzero status. Example:
    pbs_mom -s remove <scriptname>

  -s show <scriptname>
    Causes the contents of the named script to be printed to standard output. If scriptname does not exist, the operation fails, a diagnostic is presented, and pbs_mom exits with a nonzero status. Example:
    pbs_mom -s show <scriptname>

  -s list
    Causes pbs_mom to list the set of PBS-prefixed and site-defined configuration files in the order in which they will be executed. Example:
    pbs_mom -s list

WINDOWS:

Under Windows, the -N option must be used, so that pbs_mom will start up as a standalone program. For example:
    pbs_mom -N -s insert <scriptname> <inputfile>
or

```bash
pbs_mom -N -s list
--version
```

The `pbs_mom` command returns its PBS version information and exits. This option can only be used alone.

### 2.18.4 Files and Directories

- `$PBS_HOME/mom_priv`  
  Default directory for default configuration files.
- `$PBS_HOME/mom_priv/config`  
  MoM’s default configuration file.
- `$PBS_HOME/mom_logs`  
  Default directory for log files written by MoM.
- `$PBS_HOME/mom_priv/prologue`  
  File containing administrative script to be run before job execution.
- `$PBS_HOME/mom_priv/epilogue`  
  File containing administrative script to be run after job execution.

### 2.18.5 Signal Handling

`pbs_mom` handles the following signals:

- **SIGHUP**  
  The `pbs_mom` daemon will reread its configuration files, close and reopen the log file, and reinitialize resource structures.

- **SIGALRM**  
  MoM writes a log file entry. See the `-a alarm_timeout` option.

- **SIGINT**  
  The `pbs_mom` daemon exits, leaving all running jobs still running. See the `-p` option.

- **SIGKILL**  
  This signal is not caught. The `pbs_mom` daemon exits immediately.

- **SIGTERM, SIGXCPU, SIGXFSZ, SIGCPULIM, SIGSHUTDN**  
  The `pbs_mom` daemon terminates all running children and exits.
SIGPIPE, SIGUSR1, SIGUSR2, SIGINFO
These are ignored.
All other signals have their default behavior installed.

2.18.6 Exit Status

- Greater than zero if the `pbs_mom` daemon fails to start, if the `-s insert` option is used with an existing scriptname, or if the administrator attempts to add a script whose name begins with “PBS”.
- Greater than zero if the administrator attempts to use the `-s remove` option on a nonexistent configuration file, or on a configuration file whose name begins with “PBS”.
- Greater than zero if the administrator attempts to use the `-s show` option on a nonexistent script.

2.18.7 See Also

The PBS Professional Administrator’s Guide, `pbs_server(8B)`, `pbs_sched(8B)`, `qstat(1B)`, SGI’s Altix documentation

2.19 `pbs_mom_globus`

PBS no longer supports Globus. The Globus functionality has been removed from PBS.

2.20 `pbs_mpihp`

Runs an MPI application in a PBS job with HP MPI

2.20.1 Synopsis

`pbs_mpihp` 

```
pbs_mpihp [-np #] [-h host] [other HP mpirun options] program [args]
pbs_mpihp [HP mpirun options] -f appfile [-- [<extra_args>]]
pbs_mpihp --version
```
## 2.20.2 Description

The PBS command `pbs_mpihp` replaces the standard `mpirun` command in a PBS HP MPI job, for executing programs.

`pbs_mpihp` is a front end to the HP MPI version of `mpirun`. It is for PBS jobs running under Linux 2.4 and higher. `pbs_mpihp` has the same usage as `mpirun`. When `pbs_mpihp` is invoked from a PBS job, it will process the command line arguments, then call standard HP `mpirun` to actually start the MPI ranks. The ranks created will be mapped onto cpus on the nodes allocated to the PBS job. The environment variable `MPI_REMSH` will be set to `$PBS_EXEC/bin/pbs_tmrsh`. This will cause the processes that are created to become part of the PBS job.

The path to standard HP `mpirun` is found by checking to see if a link exists with the name `PBS_EXEC/etc/pbs_mpihp`. If this link exists, it will point to standard HP `mpirun`. If it does not exist, a call to `mpirun -version` will be made to determine if it is HP `mpirun`. If so, the call will be made to “`mpirun`” without an absolute path. If HP `mpirun` cannot be found, an error will be output, all temp files will be cleaned up and the script will exit with value 127.

If `pbs_mpihp` is invoked from outside a PBS job, it will pass all of its arguments directly to standard HP `mpirun` without further processing.

The first form above allows one executable to be specified. The second form above uses an appfile to list multiple executables. The format is described in the HP `mpirun` man page. If this form is used from inside a PBS job, the file will be read to determine what executables are to be run and how many processes will be started for each.

When HP MPI is wrapped with `pbs_mpihp`, “rsh” is the default used to start the mpids. If you wish to use “ssh” or something else, be sure to set the following in `$PBS_HOME/pbs_environment`:

```
PBS_RSHCOMMAND=ssh
```

or put the following in the job script:

```
export PBS_RSHCOMMAND=<rsh_cmd>
```

Executing `pbs_mpihp` with the `-client` option is not supported under PBS.

## 2.20.3 Usage

Usage is the same as for HP `mpirun`.
2.20.4 Options to pbs_mpihp

All options except the following are passed directly to HP mpirun with no modification.

-client  
  Not supported.

-np number
  Specifies the number of processes to run on the PBS nodes.

-h host
  Ignored by pbs_mpihp.

-l user
  Ignored by pbs_mpihp.

-f appfile
  The specified appfile is read by pbs_mpihp.

--version
  The pbs_mpihp command returns its PBS version information and exits. This option can only be used alone.

2.20.5 See Also

The PBS Professional Administrator’s Guide
mpirun(1)

2.21 pbs_mpilam

Runs MPI programs under PBS with LAM MPI

2.21.1 Synopsis

pbs_mpilam [options]

pbs_mpilam --version

2.21.2 Description

The PBS command pbs_mpilam replaces the standard mpirun command in a PBS LAM MPI job, for executing programs under Linux 2.4 or higher.
Usage is the same as for LAM mpirun. All options are passed directly to mpirun. If used to run a single program, PBS tracks resource usage and controls all user processes spawned by the program. If used to run multiple programs as specified in an application file (no <where> argument and no -np/-c option), then PBS does not manage the spawned user processes of each program.

If the where argument is not specified, then pbs_mpilam will try to run the user’s program on all available CPUs using the C keyword.

### 2.21.3 Options to pbs_mpilam

**(options)**

The pbs_mpilam command uses the same options as mpirun.

---

**--version**

The pbs_mpilam command returns its PBS version information and exits. This option can only be used alone.

### 2.21.4 Path

The PATH on remote machines must contain PBS_EXEC/bin.

### 2.21.5 See Also

The PBS Professional Administrator’s Guide

mpirun(1)

### 2.22 pbs_mpirun

Runs MPI programs under PBS with MPICH

#### 2.22.1 Synopsis

```
pbs_mpirun [options]
pbs_mpirun --version
```
2.22.2 Description

The PBS command `pbs_mpirun` replaces the standard `mpirun` command in a PBS MPICH job using P4 running under Linux 2.4 and higher. Usage is the same as for `mpirun`, except for the `-machinefile` option. All other options are passed directly to `mpirun`.

On Windows, this command cannot be used to start job processes or track a job's resource usage.

2.22.3 Options to pbs_mpirun

(options)

The options to `pbs_mpirun` are the same as for `mpirun`, except for the `-machinefile` option. This is generated by `pbs_mpirun`. The user should not attempt to specify `-machinefile`.

The value for `-machinefile` is a temporary file created from `PBS_NODEFILE` in the format:

```
hostname-1[:number of processors]
hostname-2[:number of processors]
hostname-n[:number of processors]
```

where if the number of processors is not specified, it is 1. An attempt by the user to specify the `-machinefile` option will result in a warning saying “Warning, -machinefile value replaced by PBS”.

The default value for the `-np` option is the number of entries in `PBS_NODEFILE`.

--version

The `pbs_mpirun` command returns its PBS version information and exits. This option can only be used alone.

2.22.4 Environment Variables

`pbs_mpirun` modifies `P4_RSHCOMMAND` and `PBS_RSHCOMMAND`. Users should not edit these. `pbs_mpirun` copies the value of `P4_RSHCOMMAND` into `PBS_RSHCOMMAND`.

2.22.5 Path

The `PATH` on remote machines must contain `PBS_EXEC/bin`.  

PBS Professional 13.0 Reference Guide   RG-71

2.23 pbs_password

Sets or updates password of a PBS user

2.23.1 Synopsis

```plaintext
pbs_password [-r] [-s server] [-d] [user]
pbs_password --version
```

2.23.2 Description

The `pbs_password` command is used to set or update the password of a PBS user. The user does not have to have any jobs on the system.

When no options are given to `pbs_password`, the password credential on the default PBS server for the current user, i.e. the user who executes the command, is updated to the prompted password. Any user jobs previously held due to an invalid password are not released.

Available on Windows and supported Linux x86 and x86_64 platforms only.

The `pbs_password` command has no effect on running jobs. Queued jobs use the new password.

The `pbs_password` command does not change the user’s password on the current host, only the password that is cached in PBS.

Note that `pbs_password` encrypts the password obtained from the user before sending it to the PBS server.

2.23.3 Options to pbs_password

**(no options)**

The user is prompted for a new password. The password credential on the default PBS server for the current user, i.e. the user who executes the command, is updated.
to the prompted password. Any user jobs previously held due to an invalid password are not released.

-\( r \)
Any user jobs previously held due to an invalid password are released.

-\( s \) server
Allows user to specify server where password will be changed.

-\( d \)
Deletes the password.

user
The password credential of user user is updated to the prompted password. If user is not the current user, this action is only allowed if one of the following is true:

- The current user is root or admin.
- User user has given the current user explicit access via the ruserok() mechanism, i.e. the hostname of the machine from which the current user is logged in appears in the server’s hosts.equiv file, or the current user has an entry in user’s HOMEDIR/.rhosts file.

--version
The pbs_password command returns its PBS version information and exits. This option can only be used alone.

2.24  pbs_probe

Reports PBS diagnostic information

2.24.1  Synopsis

```
pbs_probe [-f] [-v]
pbs_probe --version
```  

2.24.2  Description

The `pbs_probe` command reports post-installation information that is useful for PBS diagnostics. Aside from the direct information that is supplied on the command line, `pbs_probe` uses as the source for basic information the file `/etc/pbs.conf` and the values of any of the following environment variable that may be set in the environment in which `pbs_probe` is run: PBS_CONF_FILE, PBS_HOME, PBS_EXEC, PBS_START_SERVER, PBS_START_MOM, and PBS_START_SCHED.
In order to execute `pbs_probe`, the user must have PBS Operator or Manager privilege.

Used without options, the `pbs_probe` runs in “report” mode. In this mode `pbs_probe` reports on any errors in the PBS infrastructure files that it detects. The problems are categorized, and a list of the problem messages placed in each category are output. Those categories which are empty do not show in the output.

### 2.24.3 Options to `pbs_probe`

- **-f**
  Run in “fix” mode. In this mode `pbs_probe` will examine each of the relevant infrastructure files and, where possible, fix any errors that it detects, and print a message of what got changed. If it is unable to fix a problem, it will simply print a message regarding what was detected.

- **-v**
  Run in “verbose” mode. If the verbose option is turned on, `pbs_probe` will also output a complete list of the infrastructure files that it checked.

- **--version**
  The `pbs_probe` command returns its PBS version information and exits. This option can only be used alone.

### 2.24.4 Standard Error

The `pbs_probe` command will write a diagnostic message to standard error for each error occurrence.

### 2.24.5 Files

```
/etc/pbs.conf  /etc/init.d/pbs
```

### 2.24.6 See Also

The PBS Professional Administrator’s Guide and the following manual pages: `pbs_server(8B), pbs_sched(8B), pbs_mom(8B)`.

### 2.25 `pbs_python`

Python interpreter for debugging a hook script from the command line
2.25.1 Synopsis

`pbs_python <standard Python options>`

`pbs_python --version`

2.25.2 Description

The PBS Python interpreter, `pbs_python`, is a wrapper for Python.

You can use the `pbs_python` wrapper that is shipped with PBS to debug hooks. Either:

- Use the `--hook` option to `pbs_python` to run `pbs_python` as a wrapper to Python, employing the `pbs_python` options. With the `--hook` option, you cannot use the standard Python options. The rest of this section covers how to use `pbs_python` with the `--hook` option.
- Do not use the `--hook` option, so `pbs_python` runs the Python interpreter, with the standard Python options, and without access to the `pbs_python` options.

2.25.2.1 Debugging Hooks

You can get each hook to write out debugging files, and then modify the files and use them as debugging input to `pbs_python`. Alternatively, you can write the files yourself.

Debugging files can contain information about the event, about the site, and about what the hook changed. You can use these as inputs to a hook when debugging.

For a complete description of using `pbs_python` with debugging files, see section 6.16, “Debugging Hooks”, on page 639.

2.25.3 Options to `pbs_python`

`--hook`

This option is a switch. When you use this option, you can use the PBS Python module (via "import pbs"), and the other options described here are available. When you use this option, you cannot use the standard Python options. This option is useful for debugging.

When you do not use this option, you cannot use the other options listed here, but you can use the standard Python options.
-e <log_event_mask>
Sets the mask that determines which event types are logged by pbs_python. To see only debug messages, set the value to 0xd80. To see all messages, set the value to 0xffff. The pbs_python interpreter uses the same set of mask values that are used for the $logevent <mask> entry in the pbs_mom configuration file. See section 2.18, “pbs_mom”, on page 61. Available only when --hook option is used.

-i <event_input_file>
Text file containing data to populate pbs.event() objects. Each line specifies an attribute value or a resource value. Syntax of each input line is one of the following:
<object_name>.<attribute_name>=<attribute_value>
<object_name>.<resource_list>[<resource_name>]=<resource_value>
Where
<object_name> is a PBS object name which can refer to its sub-objects. Examples: "pbs.event()", "pbs.event().job", "pbs.event().vnode_list["vnode name"]".
Example input file:
```
pbs.event().hook_name=proto
pbs.event().hook_type=site
pbs.event().type=queuejob
pbs.event().requestor=user1
pbs.event().requestor_host=host1
pbs.event().hook_alarm=40
pbs.event().job.id=72
pbs.event().job.Job_Name=job1
pbs.event().job.Resource_List[ncpus]=5
pbs.event().job.Resource_List[mem]=6mb
pbs.event().vnode_list["host1"].resources_available["ncpus"] = 5
pbs.event().vnode_list["host1"].resources_available["mem"] = 300gb
```
Available only when --hook option is used.

-L <log_dir>
Directory holding the log file where pbs.logmsg() and pbs.logjobmsg() write their output. Default is current working directory where pbs_python is executed. Available only when --hook option is used.
Chapter 2  PBS Commands

-i <log_file>
Log file where pbs.logmsg() and pbs.logjobmsg() write their output. Default file name is current date in yyyyymmdd format. Available only when --hook option is used.

-o <output_file>
The output file contains the changes made after executing the hook script, such as the attributes and resources set in any pbs.event() jobs and reservations, whether to accept or reject an action, and any pbs.reject() messages.

Example output file:

```bash
pbs.event().job.Job_Name=job2
pbs.event().job.Resource_List[file]=60gb
pbs.event().job.Resource_List[ncpus]=5
pbs.event().job.Resource_List[mem]=20gb
pbs.event().job.Account_Name=account2
pbs.event().reject=True
pbs.event().reject_msg=No way!
```

Without this option, output goes to stdout. Available only when --hook option is used.

-r <resourcedef>
File/path name containing a resource definition specifying a custom resource whose Python type is pbs.resource. Format:

```bash
<resource_name>type=<typename> [flag=<value>]
```

This file has the same format as the PBS_HOME/server_priv/resourcedef file. Available only when --hook option is used.

-s <site_data_file>
The site data file can contain any relevant information about the server, queues, vnodes, and jobs at the server. This file can be written by a hook or by the administrator.

When the hook writes it, this file contains the values that populate the server, queues, vnodes, reservations, and jobs, with all attributes and resources for which there are values.

The site data file is named hook_<event type>_<hook name>_<random integer>.data. It can be passed to pbs_python using the -s <site data file> option. Available only when --hook option is used.
--version
The pbs_python command prints its version information and exits. This option can only be used alone.

2.25.4 Arguments

<python_script>
The hook script to execute. We recommend importing the PBS Python module at the start of the script:

```python
import pbs
```
If you do not specify <python script>, you can perform interactive debugging. If you type the following:

```bash
% pbs_python --hook -i hook.input
```
The interpreter displays a prompt:

```python
>>
```
You can type your Python lines at the prompt:

```python
>>import pbs
>> e=pbs.event().job
>> print e.id
<job-id>
...
```

2.26 pbs_rdel

Deletes a PBS advance or standing reservation

2.26.1 Synopsis

```
pbs_rdel reservation_identifier[,reservation_identifier...]  
pbs_rdel --version
```
2.26.2 Description

The `pbs_rdel` command deletes reservations in the order in which their reservation identifiers are presented to the command.

A reservation may be deleted by its owner, the PBS Operator, or the PBS Manager.

2.26.3 Options

--version

The `pbs_rdel` command returns its PBS version information and exits. This option can only be used alone.

2.26.4 Operands

The `pbs_rdel` command accepts one or more reservation_identifier operands.

For an advance reservation this has the form:

[R]sequence_number[.server_name][@remote_server]

For a standing reservation this has the form:

[S]sequence_number[.server_name][@remote_server]

@remote_server is used to specify a reservation at a server other than the default server.

2.26.5 Exit Status

Zero upon success.

Greater than zero upon failure to process any operand.

2.26.6 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, `pbs_rsub(1B)`, `pbs_rstat(1B)`, `pbs_resv_attributes(7B)`

2.27 `pbs_renew`

Renews Kerberos credential

RG-80 PBS Professional 13.0 Reference Guide
2.27.1 Synopsis

```bash
pbs_renew [-d] program [arg(s)]
pbs_renew --version
```

2.27.2 Description

The `pbs_renew` command is used internally by PBS when a job has a Kerberos credential. The program is run as a child process with any arguments passed to the command line of program. The `pbs_renew` process runs periodically to renew any Kerberos credential. It will wait for the child process to return, clean up any Kerberos credential and exit when the child process is done.

2.27.3 Options

- `-d`
  Debug messages are printed to stderr.

- `--version`
  The `pbs_renew` command returns its PBS version information and exits. This option can only be used alone.

2.27.4 See Also

The PBS Professional Administrator's Guide, `qsub(1B)`

2.28 `pbs_rstat`

Shows status of PBS advance or standing reservations

2.28.1 Synopsis

```bash
pbs_rstat [-F][-B][-S] [reservation_id...]
pbs_rstat --version
```
2.28.2 Description

The `pbs_rstat` command is used to show the status of all reservations on the PBS server. Denied reservations are not displayed.

This command has three different output formats: *brief* (B), *short* (S), and *full* (F). This command can be used with any level of PBS privilege.

See the `pbs_resv_attributes(7B)` man page for information about reservation attributes.

2.28.3 Options to `pbs_rstat`

- **-B Brief**
  Displays each reservation identifier only.

- **-S Short**
  Displays a table showing the name, queue, owner, state, start time, duration, and end time of each reservation.

- **-F Full**
  Displays all reservation attributes that are not set to the default value. Users without manager or operator privilege cannot print custom resources which were created to be invisible to users.

- **--version**
  The `pbs_rstat` command returns its PBS version information and exits. This option can only be used alone.

2.28.4 Output

See section 8.6, “Reservation States”, on page 437.

2.28.5 Operands

The `pbs_rstat` command accepts one or more reservation_identifier operands.

2.28.5.1 Reservations at the default server

For an advance reservation, the reservation_identifier has the form:

```
[R]sequence_number[.server_name]
```

For a standing reservation, the reservation_identifier has the form:

```
[S]sequence_number[.server_name]
```
2.28.5.2 Reservations at a server other than the default server:

Specify the remote server’s name using @remote_server.

For an advance reservation:

[R]sequence_number[.server_name][@remote_server]

For a standing reservation:

[S]sequence_number[.server_name][@remote_server]

2.28.6 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, pbs_rsub(1B), pbs_rdel(1B), pbs_resv_attributes(7B)

2.29 pbs_rsub

Creates a PBS advance or standing reservation

2.29.1 Synopsis

pbs_rsub --version

2.29.2 Description

The pbs_rsub command is used to create an advance or standing reservation. An advance reservation reserves specific resources for the requested time period, and a standing reservation reserves specific resources for recurring time periods. When a reservation is created, it has an associated queue.

After the reservation is requested, it is either confirmed or denied. Once the reservation has been confirmed, authorized users submit jobs to the reservation’s queue via qsub and qmove.
A confirmed reservation will accept jobs at any time. The jobs in its queue can run only during the reservation period, whether during a single advance reservation or during the occurrences of a standing reservation.

When an advance reservation ends, all of its jobs are deleted, whether running or queued. When an occurrence of a standing reservation ends, only its running jobs are deleted; those jobs still in the queue are not deleted.

To get information about a reservation, use the `pbs_rstat` command.

To delete a reservation, use the `pbs_rdel` command. Do not use the `qdel` command.

The behavior of the `pbs_rsub` command may be affected by any site hooks. Site hooks can modify the reservation’s attributes.

### 2.29.3 Requirements

When using `pbs_rsub` to request a reservation, the user must specify two of the following options: `-R`, `-E`, and `-D`. The resource request `-l walltime` can be used instead of the `-D` option.

### 2.29.4 Options to `pbs_rsub`

- `-D duration`
  
  Specifies reservation duration. If the start time and end time are the only times specified, this duration time is calculated.

  Format: `Duration`

  Default: none

- `-E end_time`
  
  Specifies the reservation end time. If start time and duration are the only times specified, the end time value is calculated.

  Format: `Datetime`.

  Default: none

- `-g group_list`
  
  The `group_list` is a comma-separated list of group names. The server uses entries on this list, along with an ordered set of rules, to associate a group name with the reservation. The reservation creator’s primary group is automatically added to this list.

  Format: `group@hostname[,group@hostname ...]`
PBS Commands

Chapter 2

-G auth_group_list
Comma-separated list of names of groups who can or cannot submit jobs to this reservation. Group names are interpreted in the context of the server’s host, not the context of the host from which the job is submitted.

This list becomes the acl_groups list for the reservation’s queue. More specific entries should be listed before more general, because the list is read left-to-right, and the first match determines access.

If both Authorized_Users and Authorized_Groups are set, a user must belong to both in order to be able to submit jobs to this reservation.

Refer to the Authorized_Groups reservation attribute on the pbs_resv_attributes(7B) man page.

Format: [+|-]group_name,[+|-]group_name ...

Default: All groups are authorized to submit jobs.

-H auth_host_list
Comma-separated list of hosts from which jobs can and cannot be submitted to this reservation. This list becomes the acl_hosts list for the reservation’s queue. More specific entries should be listed before more general, because the list is read left-to-right, and the first match determines access. If the reservation creator specifies this list, the creator’s host is not automatically added to the list.

See the Authorized_Hosts reservation attribute on the pbs_resv_attributes(7B) man page.

Format: [+|-]hostname,[+|-]hostname ...

Default: All hosts are authorized to submit jobs.

-I block_time
Specifies interactive mode. The pbs_rsub command will block, up to block_time seconds, while waiting for the reservation request to be confirmed or denied.

If block_time is positive, and the reservation isn’t confirmed or denied in the specified time, the ID string for the reservation is returned with the status “UNCONFIRMED”.

If block_time is negative, and the scheduler doesn’t confirm or deny the reservation in the specified time, the reservation is deleted.

Format: Integer.

Default: Not interactive.
-l placement
The placement specifies how vnodes are reserved. The place statement can contain
the following elements, in any order:

-l place=[ arrangement ][: sharing ][: grouping]
where
arrangement is one of free | pack | scatter | vscatter
sharing is one of excl | share | exclhost
grouping can have only one instance of group=resource
and where
free:
Use any vnode(s) for reservation.
pack:
All chunks are taken from one host.
scatter:
Only one chunk with any MPI processes will be taken from a host. A chunk
with no MPI processes may be taken from the same node as another chunk.
vscatter:
Only one chunk is used in any vnode.
excl:
Only this reservation uses the vnodes chosen.
exclhost:
The entire host is allocated to the reservation.
share:
This reservation can share the chosen vnodes.
group=resource:
Chunks will be grouped according to a resource. All nodes in the group must
have a common value for the resource, which can be either the built-in resource
host or a site-defined node-level resource.

Note that nodes can have sharing attributes that override reservation placement
requests.
The place statement cannot start with a colon.
See the pbs_node_attributes(7B) man page.
**-l resource_request**

The `resource_request` specifies the resources required for the reservation. These resources will be used for the limits on the queue that is dynamically created for the reservation. The aggregate amount of resources for currently running jobs from this queue will not exceed these resource limits. Jobs in the queue that request more of a resource than the queue limit for that resource are not allowed to run. Also, the queue inherits the value of any resource limit set on the server, and these are used for the job if the reservation request itself is silent about that resource. A non-privileged user cannot submit a reservation requesting a custom resource which has been created to be invisible or read-only for users.

Resources are requested by using the `-l` option, either in chunks inside of selection statements, or in job-wide requests using `resource_name=value` pairs. The selection statement is of the form:

```
-l select=[N:]chunk+[N:]chunk ...
```

where `N` specifies how many of that chunk, and a chunk is of the form:

```
resource_name=value[:resource_name=value ...]
```

Job-wide `resource_name=value` requests are of the form:

```
-l resource_name=value[,resource_name=value ...]
```

**-m mail_points**

Specifies the set of events that cause mail to be sent to the list of users specified in the `-M mail_list` option.

Format: string consisting of 1) any combination of “a”, “b”, “c” or “e”, or 2) the single character “n”.

**Table 2-3: Suboptions to -m Option**

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Notify if the reservation is terminated for whatever reason</td>
</tr>
<tr>
<td>b</td>
<td>Notify when the reservation period begins</td>
</tr>
<tr>
<td>c</td>
<td>Notify when the reservation is confirmed</td>
</tr>
<tr>
<td>e</td>
<td>Notify when the reservation period ends</td>
</tr>
<tr>
<td>n</td>
<td>Send no mail. Cannot be used with any of a, b, c or e.</td>
</tr>
</tbody>
</table>

Default: “ac”. 
Chapter 2  PBS Commands

-M mail_list
The list of users to whom mail is sent whenever the reservation transitions to one of
the states specified in the -m mail_points option.
Format: user[@hostname][.user[@hostname]...]
Default: Reservation owner.

-N reservation_name
This specifies a name for the reservation.
Format: String up to 236 characters in length. It must consist of printable, non-white
space characters with the first character alphabetic.
Default: None.

-q destination
Specifies the destination server at which to create the reservation.
Default: The default server is used if this option is not selected.

-r recurrence_rule
Specifies rule for recurrence of standing reservations. Rule must conform to iCalen-
dar syntax, and is specified using a subset of parameters from RFC 2445.
Valid syntax for the recurrence_rule takes one of two forms:
FREQ= freq_spec; COUNT= count_spec; interval_spec
or
FREQ= freq_spec; UNTIL= until_spec; interval_spec
where
freq_spec
  Frequency with which the standing reservation repeats. Valid values are:
  WEEKLY|DAILY|HOURLY
count_spec
  The exact number of occurrences. Number up to 4 digits in length.
  Integer.
interval_spec
  Specifies interval.
  Format is one or both of:
  BYDAY = MO|TU|WE|TH|FR|SA|SU
  or
  BYHOUR = 0|1|2|...|23
When using both, separate them with a semicolon.
Elements specified in the recurrence rule override those specified in the arguments to the \texttt{-R} and \texttt{-E} options. For example, the \texttt{BYHOUR} specification overrides the hourly part of the \texttt{-R} option. For example, \texttt{-R 0730 -E 0830 ... BYHOUR=9} results in a reservation that starts at 9:30 and runs for 1 hour.

\textit{until\_spec}

Occurrences will start up to but not after date and time specified. Format:

\texttt{YYYYMMDD[THHMMSS]}

Note that the year-month-day section is separated from the hour-minute-second section by a capital \texttt{T}.

Requirements:

\begin{itemize}
  \item The recurrence rule must be on one unbroken line and must be enclosed in double quotes.
  \item A start and end date must be used when specifying a recurrence rule. See the \texttt{R} and \texttt{E} options.
  \item The \texttt{PBS\_TZID} environment variable must be set at the submission host. The format for \texttt{PBS\_TZID} is a timezone location. Examples: \texttt{America/Los\_Angeles}, \texttt{America/Detroit}, \texttt{Europe/Berlin}, \texttt{Asia/Calcutta}. See the PBS Professional User’s Guide.
\end{itemize}

Examples of Standing Reservations

For a reservation that runs every day from 8am to 10am, for a total of 10 occurrences:

\begin{verbatim}
pbs_rsub -R 0800 -E 1000 -r "FREQ=DAILY;COUNT=10"
\end{verbatim}

Every weekday from 6am to 6pm until December 10 2008

\begin{verbatim}
pbs_rsub -R 0600 -E 1800 -r "FREQ=WEEKLY; BYDAY=MO,TU,WE,TH,FR; UNTIL=20081210"
\end{verbatim}

Every week from 3pm to 5pm on Monday, Wednesday, and Friday, for 9 occurrences, i.e., for three weeks:

\begin{verbatim}
pbs_rsub -R 1500 -E 1700 -r "FREQ=WEEKLY;BYDAY=MO,WE,FR; COUNT=3"
\end{verbatim}

\texttt{-R \textit{start\_time}}

Specifies reservation starting time. If the reservation’s end time and duration are the only times specified, this start time is calculated.

If the day, \texttt{DD}, is not specified, it defaults to today if the time \texttt{hhmm} is in the future. Otherwise, the day is set to tomorrow. For example, if you submit a reservation with the specification \texttt{-R 1110 at 11:15 a.m.}, it is interpreted as being for 11:10am tomorrow. If the month portion, \texttt{MM}, is not specified, it defaults to the current month, provided that the specified day \texttt{DD}, is in the future. Otherwise, the month is
Chapter 2  

PBS Commands

set to next month. Similar rules apply to the two other optional, left-side components.

Format: Datetime

-u user_list
Comma-separated list of user names. Not used. Refer to the User_List reservation attribute on the pbs_resv_attributes(7B) man page.

Format: user[@host][,user[@host] ...]

Default: None.

-U auth_user_list
Comma-separated list of users who are and are not allowed to submit jobs to this reservation. This list becomes the acl_users attribute for the reservation’s queue. More specific entries should be listed before more general, because the list is read left-to-right, and the first match determines access.

If both Authorized_Users and Authorized_Groups are set, a user must belong to both in order to be able to submit jobs to this reservation. The reservation creator’s username is automatically added to this list, whether or not the reservation creator specifies this list.

Refer to the Authorized_Users reservation attribute on the pbs_resv_attributes(7B) man page.

Format: [+|-]user@host[,+|-]user@host...]

Default: Job owner only.

-W attribute_value_list
This allows you to define other attributes for the reservation.

Supported attributes:

qmove=jobid
Converts a normal job designated by jobid into a reservation job that will run as soon as possible. Creates the reservation with its queue and moves the job into the reservation’s queue. Uses the resources requested by the job to create the reservation.

When the reservation is created, it inherits its resources from the job, not from the resources requested through the pbs_rsub command.

If the qmove option is used and the reservation is not confirmed within the timeout period, the reservation is deleted. The default timeout period is 10 seconds. There is no option for this kind of reservation to be unconfirmed.
To specify the timeout, give a negative value for the -I option. For example, to specify a timeout of 300 seconds:

```
pbs_rsub -Wqmove=<job ID> -I -300
```

The -R and -E options to `pbs_rsub` are disabled when using the `qmove=jobid` attribute.

Some shells require that you enclose a job array ID in double quotes.

Timeout must be specified with a negative number.

`--version`

The `pbs_rsub` command returns its PBS version information and exits. This option can only be used alone.

### 2.29.5 Output

The `pbs_rsub` command returns the reservation name.

For an advance reservation, this has the form

```
RNNNN.server
```

where `NNNN` is a unique integer. The associated queue’s name is the prefix, `RNNNN`.

For a standing reservation, this has the form

```
SNNNN.server
```

where `NNNN` is a unique integer. The associated queue’s name is the prefix, `SNNNN`.

### 2.30 pbs_sched

Runs the PBS scheduler
2.30.1 Synopsis

\texttt{pbs\_sched} --version

2.30.2 Description

\texttt{pbs\_sched} is the PBS scheduling daemon. It schedules PBS jobs.

\texttt{pbs\_sched} must be executed with root permission.

2.30.3 Options to \texttt{pbs\_sched}

- \texttt{-a alarm}
  - Deprecated. Will overwrite value of \texttt{sched\_cycle\_length} scheduler attribute. Time in seconds to wait for a scheduling cycle to finish.
  - Format: Time, in seconds.

- \texttt{-c clientsfile}
  - Add clients to the scheduler’s list of known clients. The \texttt{clientsfile} contains single-line entries of the form
    
    \texttt{$\text{clienthost} \ <\text{hostname}>$
  
  Each hostname is added to the list of hosts allowed to connect to the scheduler. If \texttt{clientsfile} cannot be opened, the scheduler aborts. Path can be absolute or relative. If relative, it is relative to \texttt{PBS\_HOME/sched\_priv}/.

- \texttt{-d home}
  - The directory in which the scheduler will run.
  - Default: \texttt{PBS\_HOME/sched\_priv}.

- \texttt{-L logfile}
  - The absolute path and filename of the log file. The scheduler writes its PBS version and build information to the log file whenever it starts up or the log file is rolled to a new file.
  - See the \texttt{-d} option.
  - Default: The scheduler will open a file named for the current date in the \texttt{PBS\_HOME/sched\_logs} directory.
PBS Commands

Chapter 2

-\texttt{n} \hspace{2em} \texttt{This will tell the scheduler to not restart itself if it receives a \texttt{sigsegv} or a \texttt{sigbus}.}\newline \hspace{2em} The scheduler will by default restart itself if it receives either of these two signals.\newline \hspace{2em} The scheduler will not restart itself if it receives either one within five minutes of starting.

-\texttt{N} \hspace{2em} \texttt{Instructs the scheduler not to detach itself from the current session.}

-\texttt{p file} \hspace{2em} \texttt{Any output which is written to standard out or standard error will be written to this file. The pathname can be absolute or relative, in which case it will be relative to PBS_HOME/sched_priv.}\newline \hspace{2em} \texttt{See the -d option.}\newline \hspace{2em} \texttt{Default: PBS_HOME/sched_priv/sched_out.}

-\texttt{R port} \hspace{2em} \texttt{The port for MoM to use. If this option is not given, the port number is taken from PBS_MANAGER_SERVICE_PORT, in pbs.conf.}\newline \hspace{2em} \texttt{Default: 15003.}

-\texttt{S port} \hspace{2em} \texttt{The port for the scheduler to use. If this option is not given, the default port for the PBS scheduler is taken from PBS_SCHEDULER_SERVICE_PORT, in pbs.conf.}\newline \hspace{2em} \texttt{Default: 15004.}

--\texttt{version} \hspace{2em} \texttt{The pbs_sched command returns its PBS version information and exits. This option can only be used alone.}

2.30.4 Signal Handling

\texttt{SIGHUP} \hspace{2em} \texttt{The scheduler will close and reopen its log file and reread the config file if one exists.}

\texttt{SIGALRM} \hspace{2em} \texttt{If the scheduler exceeds the time limit, the alarm will cause the scheduler to attempt to core dump and restart itself.}

\texttt{SIGINT and SIGTERM} \hspace{2em} \texttt{Will result in an orderly shutdown of the scheduler.}\newline \hspace{2em} \texttt{All other signals have the default action installed.}
Chapter 2 PBS Commands

2.30.5 Exit Status

Zero upon normal termination.

2.30.6 See Also

The PBS Professional Administrator’s Guide, pbs_server(8B), pbs_mom(8B)

2.31 pbs_server

Starts a PBS batch server

2.31.1 Synopsis

pbs_server --version

2.31.2 Description

The pbs_server command starts the operation of a batch server on the local host. Typically, this command will be in a local boot file such as /etc/rc.local. If the batch server is already in execution, pbs_server will exit with an error. To insure that the pbs_server command is not runnable by the general user community, the server will only execute if its real and effective UID is zero.

The server will record a diagnostic message in a log file for any error occurrence. The log files are maintained in the server_logs directory below the home directory of the server. If the log file cannot be opened, the diagnostic message is written to the system console. The server writes its PBS version and build information to the logfile whenever it starts up or the logfile is rolled to a new file.
To kill the server:

UNIX/Linux:

    qterm (see qterm(8B))

    or

    “kill <server_pid>”, which sends a SIGTERM.

Windows:

    if you’re running “pbs_server -N” for a standalone mode server, use

    <cntrl><break>.

2.31.3 Options to pbs_server

-a <value>
When True, the server is in state “active” and the scheduler is called to schedule jobs. When False, the server is in state “idle” and the scheduler is not called to schedule jobs. Sets the server’s scheduling attribute. If the -a T|F option is not specified, the server uses the prior value for the scheduling attribute.

Format: Boolean

-A acctfile
Specifies an absolute path name for the file to use as the accounting file. If not specified, the file is named for the current date in the PBS_HOME/server_priv/accounting directory.

-C
The server starts up, creates the database, and exits. Windows only.

-d config_path
Specifies the path of the directory which is home to the servers configuration files, PBS_HOME. A host may have multiple servers. Each server must have a different configuration directory. The default configuration directory is given by the symbol $PBS_HOME which is typically /usr/spool/PBS.

-e mask
Specifies a log event mask to be used when logging. See “log_events” in the pbs_server_attributes(7B) man page.

-F seconds
Specifies the number of seconds that the secondary server should wait before taking over when it believes the primary server is down. If the number of seconds is speci-
Chapter 2  PBS Commands

fied as -f, the secondary will make one attempt to contact the primary and then
come active.
Default: 30 seconds

-L logfile
Specifies an absolute path name of the file to use as the log file. If not specified, the
file is one named for the current date in the PBS_HOME/server_logs directory
See the -d option.

-M mom_port
Specifies the host name and/or port number on which the server should connect the
job executor, MoM. The option argument, mom_conn, is one of the forms:

host_name, [:]port_number
or

host_name:port_number
If host_name not specified, the local host is assumed. If port_number is not speci-
fied, the default port is assumed.
See the -M option for pbs_mom(8B).
Default: 15002

-N
The server runs in standalone mode. In Windows, it does not register as a Windows
service. On other platforms, MoM will not detach from the current session.

-p port
Specifies the port number on which the server will listen for batch requests. If multi-
ple servers are running on a single host, each must have its own unique port number.
This option is for use in testing with multiple batch systems on a single host.
Default: 15001

-R mom_RPPport
Specifies the port number on which the server should query the up/down status of
Mom. See the -R option for pbs_mom(8B).
Default: 15003

-s replacement_string
Specifies the string to use when replacing spaces in accounting entity names. Only
available under Windows.
-S scheduler_port
  Specifies the port number to which the server should connect when contacting the
  Scheduler. The option argument, scheduler_conn, is of the same syntax as under
  the -M option.
  Default: 15004

-t type
  Specifies behavior when the server restarts. The type argument is one of the follow-
  ing:
  cold
    All jobs are purged. Positive confirmation is required before this direction is
    accepted.
  create
    The server will discard any existing configuration files: server, nodes, queues
    and jobs, and initialize configuration files to the default values. The server is
    idled (scheduling set False).
  hot
    All jobs in the Running state are retained in that state. Any job that was
    requeued into the Queued state from the Running state when the server last
    shut down will be run immediately, assuming the required resources are avail-
    able. This returns the server to the same state as when it went down. After those
    jobs are restarted, then normal scheduling takes place for all remaining queued
    jobs. All other jobs are retained in their current state.
    If a job cannot be restarted immediately because of a missing resource, such as a
    node being down, the server will attempt to restart it periodically for up to 5
    minutes. After that period, the server will revert to a normal state, as if warm
    started, and will no longer attempt to restart any remaining jobs which were run-
    ning prior to the shutdown.
  updatedb
    Updates format of PBS data from the previous format to the data service format.
  warm
    All jobs in the Running state are retained in that state. All other jobs are main-
    tained in their current state. The job scheduler will typically make new selec-
    tions for which jobs are placed into execution. warm is the default if -t is not
    specified.

--version
  The pbs_server command returns its PBS version information and exits. This
  option can only be used alone.
2.31.4 Files

$PBS_HOME/server_priv
   default directory for configuration files.

$PBS_HOME/server_logs
   directory for log files recorded by the server.

2.31.5 Signal Handling for pbs_server

On receipt of the following signals, the server performs the defined action:

SIGHUP
   The current server log and accounting log are closed and reopened. This allows for
   the prior log to be renamed and a new log started from the time of the signal.

SIGTERM
   Causes a rapid orderly shutdown of pbs_server, identical to “qterm -t quick”.

SIGSHUTDN
   On systems (Unicos) where SIGSHUTDN is defined, it also causes an orderly
   “quick” shutdown of the server.

SIGPIPE, SIGUSR1, SIGUSR2
   These signals are ignored.

All other signals have their default behavior installed.

2.31.6 Exit Status

If the server command fails to begin batch operation, the server exits with a value greater than
zero.

and qterm(8B)
2.32  pbs_tclsh

TCL shell with TCL-wrapped PBS API

2.32.1  Synopsis

pbs_tclsh
pbs_tclsh -version

2.32.2  Description

The pbs_tclsh is a version of the TCL shell which includes wrapped versions of the PBS external API. The PBS TCL API is documented in the pbs_tclapi (3B) manual page.

Root privilege is required in order to query MoM for dynamic resources. Root privilege is not required in order to query MoM for built-in resources and site-defined static resources.

The pbs_tclsh command is used to query MoM. For example:

> pbs_tclsh
  tclsh> openrm <hostname>
  <file descriptor>
  tclsh> addreq <file descriptor> "loadave"
  tclsh> getreq <file descriptor>
  <load average>
  tclsh> closereq <file descriptor>

2.32.3  Options

  --version
  The pbs_tclsh command returns its PBS version information and exits. This option can only be used alone.

2.32.4  Standard Error

The pbs_tclsh command will write a diagnostic message to standard error for each error occurrence.
2.32.5 See Also

The PBS Professional Administrator’s Guide, the PBS Programmer’s Guide, and the following manual pages: pbs_wish(8B), pbs_server(8B), pbs_nom(8B), pbs_sched(8B)

2.33 pbs_tmrsh

TM-enabled replacement for rsh/ssh for use by MPI implementations

2.33.1 Synopsis

pbs_tmrsh host [-l username] [-n] command [args ...]

pbs_tmrsh --version

2.33.2 Description

The pbs_tmrsh command attempts to emulate an “rsh” connection to the specified host, via underlying calls to the Task Management (TM) API. The program is intended to be used during MPI integration activities, and not by end-users. The initial version of this program is targeted for use with MPICH and HP-MPI.

Running “pbs_tmrsh host command” will cause a PBS task to be started on “host” running “command”. The “host” may be in IP dot address form.

The environment variables used by the two MPI implementations to point to the rsh work-alike (MPI_REMSH in the case of HP and P4_RSHCOMMAND for MPICH) must be set in the job environment and point to the full path for pbs_tmrsh.

The file $PBS_HOME/pbs_environment will be used to set an environment variable PATH to be used to search for the program executable. This applies to both Windows and UNIX. It is expected that a full path will be specified for the command and the PATH variable will not be needed.

Output and errors are written to the PBS job’s output and error files, not to standard output/error.
2.33.3 Options

-`l username`  
  Specifies the username under which to execute the task. If used, username must match the username running the `pbs_tmrsh` command.

-`n`  
  Currently a no-op; provided for MPI implementations that expect to call `rsh` with the "--n" option.

-`--version`  
  The `pbs_tmrsh` command returns its PBS version information and exits. This option can only be used alone.

2.33.4 Standard Error

The `pbs_tmrsh` command will write a diagnostic message to the PBS job’s error file for each error occurrence.

2.33.5 Exit Status

The `pbs_tmrsh` program will exit with the exit status of the remote command or with 255 if an error occurred. This is because `ssh` works this way.

2.34 `pbs_topologyinfo`

Reports topological information about vnodes

2.34.1 Synopsis

```
pbs_topologyinfo [-a] [-s]
pbs_topologyinfo [-s <vnode name> [<vnode name> ...]]
pbs_topologyinfo [-h]
```
2.34.2 Description

The `pbs_topologyinfo` command reports topological information for one or more vnodes. To use the command, you must specify what kind of topological information you want. The command reports only the requested information.

`pbs_topologyinfo -a -s` reports socket counts for all vnodes that have reported sockets.

`pbs_topologyinfo -s <vnode name>` reports socket count for vnode `<vnode name>`.

This command is not supported on Windows.
This command must be run on the server host.

2.34.3 Permissions for `pbs_topologyinfo`

This command can be run only by root.

2.34.4 Options for `pbs_topologyinfo`

- `-a, --all`
  Reports requested topological information for all vnodes. When this option is used alone, the command does not report any information.

- `-s, --sockets`
  This option specifies socket count information. The command reports derived socket counts.

- `-h, --help`
  Prints usage and exits.

2.34.5 Operands

`<vnode name>`
Name of vnode about which to report.

2.34.6 Standard Error

0
Success
Any error following successful command line processing.
If an invalid vnode name is specified, a message is printed to standard error.

2.34.7 See Also
The PBS Professional Administrator’s Guide

2.35 pbs_wish
TK window shell with TCL-wrapped PBS API

2.35.1 Synopsis
pbs_wish
pbs_wish --version

2.35.2 Description
The pbs_wish command is a version of the TK window shell which includes wrapped versions of the PBS external API. The PBS TCL API is documented in the pbs_tclapi(3B) manual page.

2.35.3 Options
--version
   The pbs_wish command returns its PBS version information and exits. This option can only be used alone.

2.35.4 Standard Error
The pbs_wish command will write a diagnostic message to standard error for each error occurrence.
Chapter 2

2.35.5 See Also

The PBS Professional Administrator’s Guide and the following manual pages:
pbs_tclsh(8B), pbs_mom(8B), pbs_server(8B), pbs_sched(8B)

2.36 pbsdsh

Distributes task(s) to vnodes under PBS

2.36.1 Synopsis

```
pbsdsh [-c <copies>] [-s] [-v] [-o] -- program [program_args]
pbsdsh [-n <node_index>] [-s] [-v] [-o] -- program [program_args]
pbsdsh --version
```

2.36.2 Description of pbsdsh Command

The **pbsdsh** command allows you to distribute and execute a task on each of the vnodes assigned to your job by executing (spawning) the application on each vnode. The **pbsdsh** command uses the PBS Task Manager, or TM, to distribute the program on the allocated vnodes.

When run without the `-c` or the `-n` option, **pbsdsh** will spawn the program on all vnodes allocated to the PBS job. The spawns take place concurrently; all execute at (about) the same time.

Note that the double dash must come after the options and before the program and arguments. The double dash is only required for Linux.

The following example shows the **pbsdsh** command inside of a PBS batch job. The options indicate that the user wants **pbsdsh** to run the **myapp** program with one argument (**app-arg1**) on all four vnodes allocated to the job (i.e. the default behavior).

```
#!/bin/sh
#PBS -l select=4:ncpus=1
#PBS -l walltime=1:00:00

pbsdsh ./myapp app-arg1
```
The `pbsdsh` command runs one task for each line in the PBS_NODEFILE. Each MPI rank will get a single line in the PBS_NODEFILE, so if you are running multiple MPI ranks on the same host, you will still get multiple `pbsdsh` tasks on that host.

### 2.36.3 Options to `pbsdsh` Command

- **-c <copies>**
  The program is spawned copies times on the vnodes allocated, one per vnode, unless copies is greater than the number of vnodes. If copies is greater than the number of vnodes, it will wrap around, running multiple instances on some vnodes. This option is mutually exclusive with `-n`.

- **-n <node_index>**
  The program is spawned only on a single vnode, which is the `<node_index>`-th vnode allocated. This option is mutually exclusive with `-c`.

- **-o**
  No obit request is made for spawned tasks. The program will not wait for the tasks to finish.

- **-s**
  The program is run in turn on each vnode, one after the other.

- **-v**
  Produces verbose output about error conditions and task exit status.

- **--version**
  The `pbsdsh` command returns its PBS version information and exits. This option can only be used alone.

### 2.36.4 Operands

- **program**
  The first operand, `program`, is the program to execute. The double dash must precede the program under Linux.

- **program_args**
  Additional operands, `program_args`, are passed as arguments to the program.

### 2.36.5 Standard Error

The `pbsdsh` command writes a diagnostic message to standard error for each error occurrence.
2.36.6 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, qsub(1B), tm(3)

2.37 pbsfs

Shows or manipulates PBS fairshare usage data

2.37.1 Synopsis

pbsfs [-t|p]
pbsfs -g entity
pbsfs -s entity usage_value
pbsfs -d
pbsfs -e
pbsfs -c entity1 entity2
pbsfs --version

2.37.2 Description

The pbsfs command is used to print or manipulate the PBS scheduler’s fairshare usage data. Some options should only be used when the scheduler is not running. There are multiple parts to a fairshare node and you can print these data in different formats. The pbsfs command must be run by root; otherwise it will print the error message, “Unable to access fairshare data”.

The data:

- fairshare entity
  The entity in the fairshare tree.

- group
  The group ID the node is in (i.e. the node’s parent).

- cgroup
  The group ID of this group

- shares
  The number of shares the group has
usage
The amount of usage

percentage
The percentage the entity has of the tree. Note that only the leaf nodes sum to 100%.
If all of the nodes are summed, the result will be greater then 100%. Only the leaf
nodes of the tree are fairshare entities.

usage / perc
The value the scheduler will use to the pick which entity has priority over another.
The smaller the number the higher the priority.

Path from root
The path from the root of the tree to the node. This is useful because the scheduler
will look down the path to compare two nodes to see which has the higher priority.

resource
The resource for which the scheduler accumulates usage for its fairshare calcula-
tions. This defaults to cput (CPU seconds) but can be set in the scheduler’s config
file.

2.37.3 Options to pbsfs

Scheduler can be running or down:

-t
Print the fairshare tree in a hierarchical format.

-p
Print the fairshare tree in a flat format with more data.

-g entity
Print one entry with all data and print the path from the root of the tree to the node.

-c entity1 entity2
Compare two fairshare entities

--version
The pbsfs command returns its PBS version information and exits. This option
can only be used alone.

Scheduler must be down:

-s entity usage_value
Set entity’s usage value to usage_value. Please note that editing a non-leaf node is
ignored. All non-leaf node usage values are calculated each time the scheduler is
run/HUPed.
Chapter 2  

PBS Commands

- **d**
  - Decay the fairshare tree (divide all values in half)

- **e**
  - Trim fairshare tree to just the entities in the resource_group file

### 2.37.4  See Also

The PBS Professional Administrator’s Guide, `pbs_sched(8B)`

### 2.38  pbsnodes

Query PBS host status, mark hosts free or offline, change the comment for a host, or output vnode information

#### 2.38.1  Synopsis

```
pbsnodes [ -o | -r ] [-s server] [-C comment] hostname [hostname ...]
pbsnodes [-l] [-s server]
pbsnodes -v vnode [vnode ...] [-s server]
pbsnodes -a[v] [-S[j][L]] [-F json|dsv] [-D delim] [-s server]
pbsnodes -H [-S[j][L]] [-F json|dsv] [-D delim] host [host ...]
pbsnodes --version
```

#### 2.38.2  Description

The `pbsnodes` command is used to query the status of hosts, to mark hosts `FREE` or `OFFLINE`, to edit a host’s `comment` attribute, or to output vnode information. The `pbsnodes` command obtains host information by sending a request to the PBS server.

#### 2.38.2.1  Using pbsnodes

To print the status of the specified host or hosts, run `pbsnodes` with no options (except the `-s` option) and with a list of hosts.

To print the command usage, run `pbsnodes` with no options and without a list of hosts.

To remove a node from the scheduling pool, mark it `OFFLINE`. If it is marked `DOWN`, when the server next queries the MoM, and can connect, the node will be marked `FREE`. 

RG-108  

PBS Professional 13.0 Reference Guide
To offline a single vnode in a multi-vnoded system, use:

```
qmgr -c "set node <vnode name> state=offline"
```

### 2.38.2.2 Output

The order in which hosts or vnodes are listed in the output of the `pbsnodes` command is undefined. Do not rely on output being ordered.

If you print attributes, `pbsnodes` prints out only those attributes which are not at default values.

### 2.38.2.3 Permissions

PBS Manager or Operator privilege is required to execute `pbsnodes` with the `-o` or `-r` options.

Users without operator or manager privilege cannot view custom resources which have been created to be invisible to users.

### 2.38.3 Options to pbsnodes

(no options)

If neither options nor a host list is given, the `pbsnodes` command prints usage syntax.

- `-a`

Lists all hosts and all their attributes (available and used.)

When listing a host with multiple vnodes:

The output for the jobs attribute lists all the jobs on all the vnodes on that host. Jobs that run on more than one vnode will appear once for each vnode they run on.

For consumable resources, the output for each resource is the sum of that resource across all vnodes on that host.

For all other resources, e.g. string and boolean, if the value of that resource is the same on all vnodes on that host, the value is returned. Otherwise the output is the literal string "<various>".
Chapter 2  

**PBS Commands**

-C <comment>
Sets the *comment* attribute for the specified host(s) to the value of `<comment>`. Comments containing spaces must be quoted. The comment string is limited to 80 characters. Usage:

```
pbsnodes -C <comment> host1 [host2 ...]
```

To set the comment for a vnode:

```
qmgr -c "s n <vnode name> comment=<comment>"
```

-D <delimiter>
Specifies delimiter for dsv format output. Default delimiter is vertical bar ("|").

-F <json | dsv>
Specifies output format. Format can be json or dsv.

-H <host list>
Prints all non-default-valued attributes for specified hosts and all vnodes on specified hosts.
PBS Commands

Chapter 2

-j
Displays the following job-related headers for specified vnodes:

Table 2-4: Output for -j Option

<table>
<thead>
<tr>
<th>Header</th>
<th>Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vnode</td>
<td>15</td>
<td>Vnode name</td>
</tr>
<tr>
<td>state</td>
<td>15</td>
<td>Vnode state</td>
</tr>
<tr>
<td>njobs</td>
<td>6</td>
<td>Number of jobs on vnode</td>
</tr>
<tr>
<td>run</td>
<td>5</td>
<td>Number of running jobs at vnode</td>
</tr>
<tr>
<td>susp</td>
<td>6</td>
<td>Number of suspended jobs at vnode</td>
</tr>
<tr>
<td>mem fit</td>
<td>12</td>
<td>Vnode memory free/total</td>
</tr>
<tr>
<td>ncpus fit</td>
<td>7</td>
<td>Number of CPUs at vnode free/total</td>
</tr>
<tr>
<td>nmics fit</td>
<td>7</td>
<td>Number of MICs free/total</td>
</tr>
<tr>
<td>ngpus fit</td>
<td>7</td>
<td>Number of GPUs at vnode free/total</td>
</tr>
<tr>
<td>jobs</td>
<td>No restriction</td>
<td>List of job IDs on vnode</td>
</tr>
</tbody>
</table>

Note that nmics and ngpus are custom resources that must be created by the administrator if you want them displayed here.

Each subjob is treated as a unique job.

-L
Displays output with no restrictions on column width.

-l
Lists all hosts marked as DOWN or OFFLINE. Each such host’s state and comment attribute (if set) is listed. If a host also has state STATE-UNKNOWN, that will be listed. For hosts with multiple vnodes, only hosts where all vnodes are marked as DOWN or OFFLINE are listed.

-o host_list
Marks listed hosts as OFFLINE even if currently in use. This is different from being marked DOWN. A host that is marked OFFLINE will continue to execute the jobs
already on it, but will be removed from the scheduling pool (no more jobs will be scheduled on it.)

For hosts with multiple vnodes, \texttt{pbsnodes} operates on a host and all of its vnodes, where the hostname is \texttt{resources\_available\_host}, which is the name of the natural vnode. To offline a single vnode in a multi-vnoded system, use:

\begin{verbatim}
Qmgr: qmgr -c "set node <vnode name> state=offline"
\end{verbatim}

Requires PBS Manager or Operator privilege.

\texttt{-r host\_list}

Clears \texttt{OFFLINE} from listed hosts.

\texttt{-S}

Displays the following vnode information:

\begin{table}[h]
\centering
\caption{Output for -S Option}
\begin{tabular}{|l|c|p{8cm}|}
\hline
Header  & Width & Description                      \\
\hline
\texttt{name} & 15 & Vnode name                           \\
\texttt{state} & 15 & Vnode state                         \\
\texttt{OS} & 8 & Value of OS custom resource, if any \\
\texttt{hardware} & 8 & Value of \texttt{hardware} custom resource, if any \\
\texttt{host} & 15 & Hostname                             \\
\texttt{queue} & 10 & Value of vnode’s \texttt{queue} attribute \\
\texttt{ncpus} & 7 & Number of CPUs at vnode              \\
\texttt{nmics} & 7 & Number of MICs at vnode              \\
\texttt{mem} & 8 & Vnode memory                         \\
\texttt{ngpus} & 7 & Number of GPUs at vnode              \\
\texttt{comment} & No restriction & Vnode comment                     \\
\hline
\end{tabular}
\end{table}

Note that \texttt{nmics}, \texttt{ngpus} and \texttt{OS} are custom resources that must be created by the administrator if you want their values displayed here.

\texttt{-s server}

Specifies the PBS server to which to connect.
-v <vnode list>
   Lists all non-default-valued attributes for each specified vnode.
   With no arguments, prints one entry for each vnode in the PBS complex.
   With one or more vnodes specified, prints one entry for each specified vnode.

--version
   The `pbsnodes` command returns its PBS version information and exits. This option can only be used alone.

2.38.4 Operands

server
   Specifies the server to which to connect. Default: default server.

host [host ...]
   Specifies the host(s) whose status will be returned. Format:
   `hostname [hostname ...]`

vnode [vnode ...]
   Specifies the vnode(s) whose status will be returned. Format:
   `vnode name [vnode name ...]`

2.38.5 Exit Status

Zero upon success.
Greater than zero, if:
• incorrect operands are given,
• `pbsnodes` cannot connect to the server,
• there is an error querying the server for the nodes.

2.38.6 See Also

The PBS Professional Administrator’s Guide, `pbs_server(8B)` and `qmgr(8B)`

2.39 pbsrun

General-purpose wrapper script for `mpirun`
2.39.1 Synopsis

`pbsrun`

`pbsrun --version`

2.39.2 Description

`pbsrun` is a wrapper script for any of several versions of `mpirun`. This provides a user-transparent way for PBS to control jobs which call `mpirun` in their job scripts. The `pbsrun_wrap` script instantiates `pbsrun` so that the wrapper script for the specific version of `mpirun` being used has the same name as that version of `mpirun`.

If the `mpirun` wrapper script is run inside a PBS job, then it will translate any `mpirun` call of the form:

```
mpirun [options] <executable> [args]
```

into

```
mpirun [options] pbs_attach [special_option_to_pbs_attach] <executable> [args]
```

where `[special options]` refer to any option needed by `pbs_attach` to do its job (e.g. `-j $PBS_JOBID`).

If the wrapper script is executed outside of PBS, a warning is issued about “not running under PBS”, but it proceeds as if the actual program had been called in standalone fashion.

The `pbsrun` wrapper script is not meant to be executed directly but instead it is instantiated by `pbsrun_wrap`. It is copied to the target directory and renamed “`pbsrun.<mpirun version/flavor>`” where `<mpirun version/flavor>` is a string that identifies the `mpirun` version being wrapped (e.g. ch_gm).

The `pbsrun` script, if executed inside a PBS job, runs an initialization script, named `$PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.init`, then parses `mpirun`-like arguments from the command line, sorting which options and option values to retain, to ignore, or to transform, before calling the actual `mpirun` script with a “`pbs_attach`” prefixed to the executable. The actual `mpirun` to call is found by tracing the link pointed to by `$PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.link`.

For all of the wrapped MPIs, the maximum number of ranks that can be launched is the number of entries in `$PBS_NODEFILE`.
The wrapped MPIs are:

- MPICH-GM’s `mpirun (mpirun.ch_gm)` with `rsh/ssh`
- MPICH-MX’s `mpirun (mpirun.ch_mx)` with `rsh/ssh`
- MPICH-GM’s `mpirun (mpirun.mpd)` with MPD
- MPICH-MX’s `mpirun (mpirun.mpd)` with MPD
- MPICH2’s `mpirun`
- Intel MPI’s `mpirun` (deprecated as of 13.0)
- MVAPICH1’s `mpirun`
- MVAPICH2’s `mpiexec`
- IBM’s `poe`

### 2.39.3 Options

`--version`

The `pbsrun` command returns its PBS version information and exits. This option can only be used alone.

### 2.39.4 Initialization Script

The initialization script, called `$PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.init`, where `<mpirun version/flavor>` reflects the `mpirun` flavor/version being wrapped, can be modified by an administrator to customize against the local flavor/version of `mpirun` being wrapped.

Inside this sourced init script, 8 variables are set:

```bash
options_to_retain="-optA -optB <val> -optC <val1> val2> ..."
options_to_ignore="-optD -optE <n> -optF <val> val2> ...
options_to_transform="-optG -optH <val> -optI <val1> val2> ...
options_to_fail="-optY -optZ ...
options_to_configfile="-optX <val> ...
options_with_another_form="-optW <val> ...
pbs_attach=pbs_attach
options_to_pbs_attach="-J $PBS_JOBID"
```
2.39.4.1 Initialization Script Options

options_to_retain
Space-separated list of options and values that pbsrun.<mpirun version/flavor> passes on to the actual mpirun call. Options must begin with “-” or “--”, and option arguments must be specified by some arbitrary name with left and right arrows, as in “<val>”.

options_to_ignore
Space-separated list of options and values that pbsrun.<mpirun version/flavor> does not pass on to the actual mpirun call. Options must begin with “-” or “--”, and option arguments must be specified by arbitrary names with left and right arrows, as in “<n>”.

options_to_transform
Space-separated list of options and values that pbsrun modifies before passing on to the actual mpirun call.

option_to_fail
Space-separated list of options that will cause pbsrun to exit upon encountering a match.

options_to_configfile
Single option and value that refers to the name of the “configfile” containing command line segments found in certain versions of mpirun.

options_with_another_form
Space-separated list of options and values that can be found in options_to_retain, options_to_ignore, or options_to_transform, whose syntax has an alternate, unsupported form.

pbs_attach
Path to pbs_attach, which is called before the <executable> argument of mpirun.

options_to_pbs_attach
Special options to pass to the pbs_attach call. You may pass variable references (e.g. $PBS_JOBID) and they are substituted by pbsrun to actual values.

If pbsrun encounters any option not found in options_to_retain, options_to_ignore, and options_to_transform, then it is flagged as an error.
These functions are created inside the init script. These can be modified by the PBS administrator.

```bash
transform_action () {
    # passed actual values of $options_to_transform
    args=$*
}
```

```bash
boot_action () {
    mpirun_location=$1
}
```

```bash
evaluate_options_action () {
    # passed actual values of transformed options
    args=$*
}
```

```bash
configfile_cmdline_action () {
    args=$*
}
```

```bash
end_action () {
    mpirun_location=$1
}
```

**transform_action()**

The `pbsrun.<mpirun version/flavor>` wrapper script invokes the function `transform_action()` (called once on each matched item and value) with actual options and values received matching one of the “`options_to_transform`”. The function returns a string to pass on to the actual `mpirun` call.

**boot_action()**

Performs any initialization tasks needed before running the actual `mpirun` call. For instance, GM’s MPD requires the MPD daemons to be user-started first. This func-
Chapter 2

PBS Commands

tion is called by the pbsrun.<mpirun version/flavor> script with the location of actual mpirun passed as the first argument. Also, the pbsrun.<mpirun version/flavor> checks for the exit value of this function to determine whether or not to progress to the next step.

evaluate_options_action()
Called with the actual options and values that resulted after consulting options_to_retain, options_to_ignore, options_to_transform, and executing transform_action(). This provides one more chance for the script writer to evaluate all the options and values in general, and make any necessary adjustments, before passing them on to the actual mpirun call. For instance, this function can specify what the default value is for a missing -np option.

configfile_cmdline_action()
Returns the actual options and values to be put in before the option_to_configfile parameter.

configfile_firstline_action()
Returns the item that is put in the first line of the configuration file specified in the option_to_configfile parameter.

end_action()
Called by pbsrun.<mpirun version/flavor> at the end of execution. It undoes any action done by transform_action(), like cleanup of temporary files. It is also called when pbsrun.<mpirun version/flavor> is prematurely killed. This function is called with the location of actual mpirun passed as first argument.

The actual mpirun program to call is the path pointed to by $PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.link.”

2.39.4.2 Modifying *.init Scripts

In order for administrators to modify *.init scripts without breaking package verification in RPM, master copies of the initialization scripts are named *.init.in. pbsrun_wrap instantiates the *.init.in files as *.init. For instance, $PBS_EXEC/lib/MPI/pbsrun.mpich2.init.in is the master copy, and pbsrun_wrap instantiates it as $PBS_EXEC/lib/MPI/pbsrun.mpich2.init. pbsrun_unwrap takes care of removing the *.init files.
2.39.5 Versions/Flavors of mpirun

2.39.5.1 MPICH-GM mpirun (mpirun.ch_gm) with rsh/ssh: pbsrun.ch_gm

2.39.5.1.i Syntax

`pbsrun.ch_gm <options> <executable> <arg1> <arg2> ... <argn>`

The PBS wrapper script to MPICH-GM's `mpirun (mpirun.ch_gm)` with rsh/ssh process startup method is named `pbsrun.ch_gm`.

If executed inside a PBS job, this allows for PBS to track all MPICH-GM processes started by rsh/ssh so that PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard `mpirun.ch_gm` was used.

2.39.5.1.ii Options Handling

If executed inside a PBS job script, all `mpirun.ch_gm` options given are passed on to the actual `mpirun` call with these exceptions:

- `-machinefile <file>`
  The file argument contents are ignored and replaced by the contents of the `$PBS_NODEFILE`.

- `-np`
  If not specified, the number of entries found in the `$PBS_NODEFILE` is used.

- `-pg`
  The use of the `-pg` option, for having multiple executables on multiple hosts, is allowed but it is up to user to make sure only PBS hosts are specified in the process group file; MPI processes spawned are not guaranteed to be under the control of PBS.

2.39.5.1.iii Wrap/Unwrap

To wrap MPICH-GM's `mpirun` script:

```
# pbsrun_wrap [MPICH-GM_BIN_PATH]/mpirun.ch_gm pbsrun.ch_gm
```

To unwrap MPICH-GM's `mpirun` script:

```
# pbsrun_unwrap pbsrun.ch_gm
```
2.39.5.2  MPICH-MX mpi run (mpi run.ch_mx) with rsh/ssh: pbsrun.ch_mx

2.39.5.2.i  Syntax

pbsrun.ch_mx <options> <executable> <arg1> <arg2> ... <argn>

The PBS wrapper script to MPICH-MX's mpi run (mpi run.ch_gm) with rsh/ssh process startup method is named pbsrun.ch_mx.

If executed inside a PBS job, this allows for PBS to track all MPICH-MX processes started by rsh/ssh so that PBS can perform accounting and has complete job control.

If executed outside of a PBS job, it behaves exactly as if standard mpi run.ch_mx was used.

2.39.5.2.ii  Options HANDLING

If executed inside a PBS job script, all mpi run.ch_gm options given are passed on to the actual mpi run call with some exceptions:

- -machinefile <file>
  The file argument contents is ignored and replaced by the contents of the $PBS_NODEFILE.

- -np
  If not specified, the number of entries found in the $PBS_NODEFILE is used.

- -pg
  The use of the -pg option, for having multiple executables on multiple hosts, is allowed but it is up to user to make sure only PBS hosts are specified in the process group file; MPI processes spawned are not guaranteed to be under the control of PBS.

2.39.5.2.iii  Wrap/Unwrap

To wrap MPICH-MX's mpi run script:

# pbsrun_wrap [MPICH-MX BIN PATH]/mpi run.ch_mx pbsrun.ch_mx

To unwrap MPICH-MX's mpi run script:

# pbsrun_unwrap pbsrun.ch_mx

2.39.5.3  MPICH-GM mpi run (mpi run.mpd) with MPD: pbsrun.gm_mpd

2.39.5.3.i  Syntax

pbsrun.gm_mpd <options> <executable> <arg1> <arg2> ... <argn>
PBS Commands

Chapter 2

The PBS wrapper script to MPICH-GM's `mpirun` (mpirun.ch_gm) with MPD process startup method is called `pbsrun.gm_mpd`.

If executed inside a PBS job, this allows for PBS to track all MPICH-GM processes started by the MPD daemons so that PBS can perform accounting have and complete job control.

If executed outside of a PBS job, it behaves exactly as if standard `mpirun.ch_gm` with MPD was used.

2.39.5.3.ii Options Handling

If executed inside a PBS job script, all `mpirun.ch_gm` with MPD options given are passed on to the actual `mpirun` call with these exceptions:

- `-m <file>`
  The file argument contents are ignored and replaced by the contents of the `$PBS_NODEFILE`.

- `-np`
  If not specified, the number of entries found in the `$PBS_NODEFILE` is used.

- `-pg`
  The use of the `-pg` option, for having multiple executables on multiple hosts, is allowed but it is up to user to make sure only PBS hosts are specified in the process group file; MPI processes spawned are not guaranteed to be under the control of PBS.

2.39.5.3.iii Startup/Shutdown

The script starts MPD daemons on each of the unique hosts listed in `$PBS_NODEFILE`, using either `rsh` or `ssh` method based on value of environment variable `RSHCOMMAND`. The default is `rsh`.

The script also takes care of shutting down the MPD daemons at the end of a run.

2.39.5.3.iv Wrap/Unwrap

To wrap MPICH-GM's `mpirun` script with MPD:

```
# pbsrun_wrap [MPICH-GM_BIN_PATH]/mpirun.mpd pbsrun.gm_mpd
```

To unwrap MPICH-GM's `mpirun` script with MPD:

```
# pbsrun_unwrap pbsrun.gm_mpd
```
Chapter 2  PBS Commands

2.39.5.4  MPICH-MX mpirun (mpirun.mpd) with MPD:
          pbsrun.mx_mpd

2.39.5.4.i  Syntax

  pbsrun.mx_mpd <options> <executable> <arg1> <arg2> ... <argn>

  The PBS wrapper script to MPICH-MX's mpirun (mpirun.ch_mx) with MPD process
  startup method is called pbsrun.mx_mpd.

  If executed inside a PBS job, this allows for PBS to track all MPICH-MX processes started by
  the MPD daemons so that PBS can perform accounting and have complete job control.

  If executed outside of a PBS job, it behaves exactly as if standard mpirun.ch_mx with MPD
  was used.

2.39.5.4.ii  Options Handling

  If executed inside a PBS job script, all mpirun.mx_mpd with MPD options given are passed
  on to the actual mpirun call with these exceptions:

    -m <file>
      The file argument contents are ignored and replaced by the contents of the
      $PBS_NODEFILE.

    -np
      If not specified, the number of entries found in the $PBS_NODEFILE is used.

    -pg
      The use of the -pg option, for having multiple executables on multiple hosts, is
      allowed but it is up to user to make sure only PBS hosts are specified in the process
      group file; MPI processes spawned are not guaranteed to be under the control of
      PBS.

2.39.5.4.iii  Startup/Shutdown

  The script starts MPD daemons on each of the unique hosts listed in $PBS_NODEFILE,
  using either rsh or ssh method, based on value of environment variable RSHCOMMAND -
  - rsh is the default.

  The script also takes care of shutting down the MPD daemons at the end of a run.

2.39.5.4.iv  Wrap/Unwrap

  To wrap MPICH-MX's mpirun script with MPD:

    # pbsrun_wrap [MPICH-MX_BIN_PATH]/mpirun.mpd pbsrun.mx_mpd
To unwrap MPICH-MX’s mpirun script with MPD:

```bash
# pbsrun_unwrap pbsrun.mx_mpd
```

### 2.39.5.5 MPICH2 mpirun: pbsrun.mpich2

#### 2.39.5.5.i Syntax

```bash
pbsrun.mpich2 [global args] [local args] executable [args] [: [local args] executable [args]]
```

- or -

```bash
pbsrun.mpich2 -configfile <configfile>
```

where `<configfile>` contains command line segments as lines:

- `[local args] executable1 [args]`
- `[local args] executable2 [args]`
- `[local args] executable3 [args]`

The PBS wrapper script to MPICH2's `mpirun` is called `pbsrun.mpich2`.

If executed inside a PBS job, this allows for PBS to track all MPICH2 processes so that PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard MPICH2’s `mpirun` was used.

#### 2.39.5.5.ii Options Handling

If executed inside a PBS job script, all MPICH2’s `mpirun` options given are passed on to the actual `mpirun` call with these exceptions:

- `--host` and `--ghost`
  For specifying the execution host to run on. Not passed on to the actual `mpirun` call.

- `-machinefile <file>`
  The file argument contents are ignored and replaced by the contents of the `$PBS_NODEFILE`.

**MPICH2`s `mpirun` -localonly `<x>`**

For specifying the `<x>` number of processes to run locally. Not supported. The user is advised instead to use the equivalent arguments: `-np `<x>` -localonly`. The reason for this is that the `pbsrun` wrapper script cannot handle a variable number of arguments to an option (e.g. “-localonly” has 1 argument and “-localonly `<x>`” has 2 arguments).
-np
If user did not specify a -np option, then no default value is provided by the PBS wrapper scripts. It is up to the local mpirun to decide what the reasonable default value should be, which is usually 1.

2.39.5.5.iii Startup/Shutdown
The script takes care of ensuring that the MPD daemons on each of the hosts listed in the $PBS_NODEFILE are started. It also takes care of ensuring that the MPD daemons have been shut down at the end of MPI job execution.

2.39.5.5.iv Wrap/Unwrap
To wrap MPICH2’s mpirun script:

    # pbsrun_wrap [MPICH2_BIN_PATH]/mpirun pbsrun.mpich2

To unwrap MPICH2’s mpirun script:

    # pbsrun_unwrap pbsrun.mpich2

In the case where MPICH2 uses mpirun.py, run pbsrun_wrap on mpirun.py itself.

2.39.5.6 Intel MPI mpirun: pbsrun.intelmpi (Deprecated)
Wrapping Intel MPI, and support for mpdboot, are deprecated.

2.39.5.6.i Syntax

    pbsrun.intelmpi [mpdboot options] [mpiexec options] executable [prog-args] [: [mpiexec options] executable [prog-args]]
    - or -

    pbsrun.intelmpi [mpdboot options] -f <configfile>

where [mpdboot options] are any options to pass to the mpdboot program, which is automatically called by Intel MPI’s mpirun to start MPDs, and <configfile> contains command line segments as lines.

The PBS wrapper script to Intel MPI’s mpirun is called pbsrun.intelmpi.

If executed inside a PBS job, this allows for PBS to track all Intel MPI processes so that PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard Intel MPI’s mpirun was used.
2.39.5.6.ii Options Handling

If executed inside a PBS job script, all of the options to the PBS interface to Intel MPI’s mpirun are passed to the actual mpirun call with these exceptions:

- **-host and -ghost**
  For specifying the execution host to run on. Not passed on to the actual mpirun call.

- **-machinefile <file>**
  The file argument contents are ignored and replaced by the contents of the $PBS_NODEFILE.

- **mpdboot options --totalnum=* and --file=***
  Ignored and replaced by the number of unique entries in $PBS_NODEFILE and name of $PBS_NODEFILE respectively.

- **arguments to mpdboot options --file=* and -f <mpd_hosts_file>**
  Replaced by $PBS_NODEFILE.

- **-s**
  If pbsrun.intelmpi is called inside a PBS job, Intel MPI’s mpirun -s argument to mpdboot are not supported as this closely matches the mpirun option -s <spec>. The user can simply run a separate mpdboot -s before calling mpirun.
  A warning message is issued by pbsrun.intelmpi upon encountering a -s option telling users of the supported form.

- **-np**
  If the user does not specify a -np option, then no default value is provided by the PBS wrap scripts. It is up to the local mpirun to decide what the reasonable default value should be, which is usually 1.

2.39.5.6.iii Startup/Shutdown

Intel MPI’s mpirun itself takes care of starting/stopping the MPD daemons. pbsrun.intelmpi always passes the arguments -totalnum=<number of mpds to start> and -file=<mpd_hosts_file> to the actual mpirun, taking its input from unique entries in $PBS_NODEFILE.

2.39.5.6.iv Wrap/Unwrap

To wrap Intel MPI’s mpirun script:

```bash
# pbsrun_wrap [INTEL_MPI_BIN_PATH]/mpirun pbsrun.intelmpi
```

To unwrap Intel MPI’s mpirun script:

```bash
# pbsrun_unwrap pbsrun.intelmpi
```
2.39.5.7 MVAPICH1 mpirun: pbsrun.mvapich1

2.39.5.7.i Syntax

\[ \text{pbsrun.mvapich1 <mpirun options> <executable> <options>} \]

The PBS wrapper script to MVAPICH1’s mpirun is called pbsrun.mvapich1. Only one executable can be specified. MVAPICH1 allows the use of InfiniBand.

If executed inside a PBS job, this allows for PBS to be aware of all MVAPICH1 ranks and track their resources, so that PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard mpirun was used.

2.39.5.7.ii Options Handling

If executed inside a PBS job script, all mpirun options given are passed on to the actual mpirun call with these exceptions:

- `map <list>`
  The map option is ignored.

- `exclude <list>`
  The exclude option is ignored.

- `machinefile <file>`
  The machinefile option is ignored.

- `np`
  If not specified, the number of entries found in the \$PBS_NODEFILE is used.

2.39.5.7.iii Wrap/Unwrap

To wrap MVAPICH1’s mpirun script:

\# pbsrun_wrap <path-to-actual-mpirun> pbsrun.mvapich1

To unwrap MVAPICH1’s mpirun script:

\# pbsrun_unwrap pbsrun.mvapich1

2.39.5.8 MVAPICH2 mpiexec: pbsrun.mvapich2

2.39.5.8.i Syntax

\[ \text{pbsrun.mvapich2 <mpiexec args> executable <executable's args> [: <mpiexec args> executable <executable's args>]} \]

The PBS wrapper script to MVAPICH2's mpiexec is called pbsrun.mvapich2.
Multiple executables can be specified using the colon notation. MVAPICH2 allows the use of InfiniBand.

If executed inside a PBS job, this allows for PBS to be aware of all MVAPICH2 ranks and track their resources, so that PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard mpiexec was used.

2.39.5.8.ii Options Handling

If executed inside a PBS job script, all mpiexec options given are passed on to the actual mpiexec call with these exceptions:

- `-host <host>`
  The host argument contents are ignored.

- `-machinefile <file>`
  The file argument contents are ignored and replaced by the contents of the $PBS_NODEFILE.

2.39.5.8.iii Wrap/Unwrap

To wrap MVAPICH2's mpiexec script:

```
# pbsrun_wrap <path-to-actual-mpiexec> pbsrun.mvapich2
```

To unwrap MVAPICH2's mpiexec script:

```
# pbsrun_unwrap pbsrun.mvapich2
```

2.39.5.9 IBM poe: pbsrun.poe

2.39.5.9.i Syntax

```
pbsrun.poe <options> <executable> <arg1> <arg2> ... <argn>
```

The PBS wrapper script to IBM's poe is called pbsrun.poe.

MPI is supported under IBM's Parallel Operating Environment (POE) on AIX. Under AIX, the program poe is used to start user processes on remote machines. PBS will manage the IBM HPS in US (User Space) mode.

The PBS wrapper script to IBM's poe allows LAPI or MPI programs to use InfiniBand or the HPS in US mode.

If executed inside a PBS job, this allows for PBS to track all resources and MPI ranks. PBS can perform accounting and have complete job control.

If executed outside of a PBS job, it behaves exactly as if standard poe was used.
Chapter 2  

PBS Commands

The script will use the `-euilib {ip | us}` option and the MP_EUILIB environment variable to indicate use of US mode, to maintain compatibility with standard poe.

2.39.5.9.ii Options and Environment Variables

Users submitting jobs whose programs use poe can set environment variables instead of using options to poe. The equivalent environment variable is listed with its poe option. If executed inside a PBS job script, all pbsrun.poe options and environment variables except the following are passed on to poe:

- **-devtype, MP_DEVTYPE**
  - If InfiniBand is not specified in either the option or the environment variable, the InfiniBand interconnect is not used for the program.

- **-euidevice, MP_EUIDEVICE**
  - Ignored by PBS.

- **-euilib {ip|us}, MP_EUILIB**
  - If the command line option `-euilib` is set, it will take precedence over the MP_EUILIB environment variable. If set to “us”, the program uses User Space mode. If set to any other value, that value is passed to IBM poe.

- **-hostfile, -hfile, MP_HOSTFILE**
  - Ignored. If this is specified, PBS prints the following:
    - “pbsrun.poe: Warning, -hostfile value replaced by PBS”
  - or
    - “pbsrun.poe: Warning -hfile value replaced by PBS”
  - If this environment variable is set when a poe job is submitted, PBS prints the following error message:
    - “pbsrun.poe: Warning MP_HOSTFILE value replaced by PBS”

- **-instances, MP_INSTANCES**
  - The option and the environment variable are treated differently:
    - **-instances**
      - If the option is set, PBS prints a warning:
        - “pbsrun.poe: Warning, -instances cmd line option removed by PBS”
    - **MP_INSTANCES**
      - If the environment variable is set, PBS uses it to calculate the number of network windows for the job. The maximum value allowed can be requested by using the string “max” for the environment variable. If the environment variable is set to a value greater than the maximum allowed value, it is replaced with the maximum allowed value. The default maximum value is 4.
-procs, MP_PROCS
This option or environment variable should be set to the total number of mpiproc
requested by the job when using US mode. If neither this option nor the
MP_PROCS environment variable is set, PBS uses the number of entries in
$PBS_NODEFILE. If this option is set to \( N \), and the job is submitted with a total of
\( M \) mpiproc:
If \( N \geq M \):
The value \( N \) is passed to IBM poe.
If \( N < M \) and US mode is not being used:
The value \( N \) is passed to poe.
If \( N < M \) and US mode is being used:
US mode is turned off and a warning is printed:
"pbsrun.poe: Warning, user mode disabled due to MP_PROCS setting"

2.39.5.9.iii Wrap/Unwrap
To wrap IBM’s poe:

```
# pbsrun_wrap <path_to_actual_poe> pbsrun.poe
```

To unwrap the IBM poe:

```
# pbsrun_unwrap pbsrun.poe
```

2.39.6 Requirements

The mpirun being wrapped must be installed and working on all the nodes in the PBS clus-
ter.

2.39.7 Errors

If pbsrun encounters any option not found in options_to_retain, options_to_ignore, and
options_to_transform, then it is flagged as an error.

The PBS Professional Administrator’s Guide
pbs_attach(8B), pbsrun_wrap(8B), pbsrun_unwrap(8B)
2.40 pbsrun_unwrap

Unwraps mpirun, reversing pbsrun_wrap

2.40.1 Synopsis

`pbsrun_unwrap pbsrun.<mpirun version/flavor>`

`pbsrun_unwrap --version`

2.40.2 Description

The `pbsrun_unwrap` script is used to reverse the actions of the `pbsrun_wrap` script. Use `pbsrun_wrap` to wrap `mpirun`. Using `pbsrun_unwrap` for Intel MPI is deprecated.

2.40.3 Usage

2.40.3.1 Syntax:

`pbsrun_unwrap pbsrun.<mpirun version/flavor>`

For example, running the following:

```
pbsrun_unwrap pbsrun.ch_gm
```

causes the following actions:

Checks for a link in `$PBS_EXEC/lib/MPI/pbsrun.ch_gm.link`; If one exists, get the pathname it points to:

```
/opt/mpich-gm/bin/mpirun.ch_gm.actual
rm $PBS_EXEC/lib/MPI/pbsrun.mpirun.ch_gm.link
rm /opt/mpich-gm/bin/mpirun.ch_gm
rm $PBS_EXEC/bin/pbsrun.ch_gm
mv /opt/mpich-gm/bin/mpirun.ch_gm.actual /opt/mpich-gm/bin/mpirun.ch_gm
```
2.40.4 Options

--version
The pbsrun_unwrap command returns its PBS version information and exits. This option can only be used alone.

2.41 pbsrun_wrap
General-purpose script for wrapping mpirun in pbsrun

2.41.1 Synopsis
pbsrun_wrap [-s] <path_to_actual_mpirun> pbsrun.<mpirun version/flavor>
pbsrun_wrap --version

2.41.2 Description
The pbsrun_wrap script is used to wrap any of several versions of mpirun in pbsrun. The pbsrun_wrap script creates a symbolic link with the same path and name as the mpirun being wrapped. This calls pbsrun, which uses pbs_attach to give MoM control of jobs. The result is transparent to the user; when mpirun is called from inside a PBS job, PBS can monitor and control the job, but when mpirun is called from outside of a PBS job, it behaves as it would normally. See the pbs_attach(8B) and pbsrun(8B) man pages.
Use pbsrun_unwrap to reverse the process.
Using pbsrun_wrap for Intel MPI is deprecated.

2.41.3 Options
-s
Sets the “strict_pbs” options in the various initialization scripts (e.g. pbsrun.bgl.init, pbsrun.ch_gm.init, etc..) to 1 from the default 0.
This means that the mpirun being wrapped by pbsrun will only be executed if inside a PBS environment. Otherwise, the user will get the error:

Not running under PBS exiting since strict_pbs is enabled; execute only in PBS

--version

The pbsrun_wrap command returns its PBS version information and exits. This option can only be used alone.

2.41.4 USAGE

2.41.4.1 Syntax:

```
pbsrun_wrap [-s] <path_to_actual_mpirun> pbsrun.<mpirun version/flavor>
```

Any mpirun version/flavor that can be wrapped has an initialization script ending in “.init”, found in $PBS_EXEC/lib/MPI:

```
$PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.init.
```

The pbsrun_wrap script instantiates the pbsrun wrapper script as pbsrun.<mpirun version/flavor> in the same directory where pbsrun is located, and sets up the link to actual mpirun call via the symbolic link

```
$PBS_EXEC/lib/MPI/pbsrun.<mpirun version/flavor>.link
```

For example, running:

```
pbsrun_wrap /opt/mpich-gm/bin/mpirun.ch_gm pbsrun.ch_gm
```

does the following actions:

- Save original mpirun.ch_gm script:

  `mv /opt/mpich-gm/bin/mpirun.ch_gm /opt/mpich/gm/bin/mpirun.ch_gm.actual`

- Instantiate pbsrun wrapper script as pbsrun.ch_gm:

  `cp $PBS_EXEC/bin/pbsrun $PBS_EXEC/bin/pbsrun.ch_gm`

- Link “mpirun.ch_gm” to actually call “pbsrun.ch_gm”:

  `ln -s $PBS_EXEC/bin/pbsrun.ch_gm /opt/mpich-gm/bin/mpirun.ch_gm`

- Create a link so that “pbsrun.ch_gm” calls “mpirun.ch_gm.actual”:

  `ln -s /opt/mpich-gm/bin/mpirun.ch_gm.actual $PBS_EXEC/lib/MPI/pbsrun.ch_gm.link`
2.41.5 Requirements

The `mpirun` being wrapped must be installed and working on all the nodes in the PBS cluster.

2.42 printjob

Prints job information

2.42.1 Synopsis

```
printjob [-a | -s ] job ID
printjob [-a ] <file path> [<file path>...]
printjob --version
```

2.42.2 Description

The `printjob` command is used to print job information. You can print information either from the server, using a job ID, or from the execution host, using a file path.

Whether or not a MoM is running on the server host, you must use the job ID at the server host.

By default all the job data including job attributes are printed. This can be suppressed with the `-a` option.

You can print out just the job script using the `-s` option at the server and execution hosts.

This command is mainly useful for troubleshooting, as during normal operation, the `qstat(8B)` command is the preferred method for displaying job-specific data and attributes.

2.42.3 Permissions

In order to execute `printjob`, the user must have root or Windows Administrator privilege.
2.42.4 Options to printjob

(no options>
  Prints all job data including job attributes.

-a
  Suppresses the printing of job attributes. Cannot be used with -s option.

-s
  Prints out the job script only. Cannot be used with -a option. Cannot be used with file path argument.

--version
  The printjob command returns its PBS version information and exits. This option can only be used alone.

2.42.5 Operands for printjob

<file path>
  The printjob command accepts one or more file path operands at the execution host. Files are found in PBS_HOME/mom_priv/jobs/ on the primary execution host. File path must include full path to file. Cannot be used with -s option.

<job ID>
  The printjob command accepts a job ID at the server host. The format is described in section “Job Identifier”, on page 424. Data service must be running.

2.42.6 Standard Error

The printjob command writes a diagnostic message to standard error for each error occurrence.

2.42.7 Exit Status

Zero upon successful processing of all the operands presented to the printjob command. Greater than zero if the printjob command fails to process any operand.

2.42.8 See Also

2.43 qalter

Alters a PBS job

2.43.1 Synopsis

```
```

2.43.2 Description

The `qalter` command is used to alter one or more PBS batch jobs. The attributes listed with the options to the `qalter` command can be modified. If any of the modifications to a job fails, none of the job’s attributes is modified.

A job that is in the process of provisioning cannot be altered.

2.43.2.1 Required privilege

- A non-privileged user may only lower the limits for resources and the value of `run_count`
- A Manager or Operator may lower or raise requested resource limits, except for per-process limits such as `pcput` and `pmem`, because these are set when the process starts, and enforced by the kernel.
- The `qalter` command cannot be used by a non-privileged user to alter a custom resource which has been created to be invisible or read-only for users.

2.43.2.2 Modifying resources and job placement:

If a job is running, the only resources that can be modified are `cput` (CPU time) and `walltime`.

If a job is queued, any resource mentioned in the options to the `qalter` command can be modified, but requested modifications must fit within the limits set at the server and queue for the amount of each resource allocated for queued jobs. If a requested modification does not fit within these limits, the modification is rejected.

Note that a job’s resource request must fit within the queue’s and server’s resource run limits. If a modification to a resource exceeds the amount of the resource allowed by the queue or server to be used by running jobs, the job is never run.
Resources are modified by using the -l option, either in chunks inside of selection statements, or in job-wide modifications using resource_name=value pairs. The selection statement is of the form:

```
-l select=[N:]chunk+[N:]chunk ...
```

where \( N \) specifies how many of that chunk, and a chunk is of the form:

```
resource_name=value[resource_name=value ...]
```

Job-wide resource_name=value modifications are of the form:

```
-l resource_name=value[resource_name=value ...]
```

Placement of jobs on nodes is changed using the place statement:

```
-l place=modifier[:modifier]
```

where modifier is any combination of group, excl, and/or one of free|pack|scatter.

For more on resource requests, usage limits and job placement, see pbs_resources(7B).

### 2.43.2.3 Modifying attributes:

The user alters job attributes by giving options to the qalter command. Each qalter option changes a job attribute.

The behavior of the qalter command may be affected by any site hooks. Site hooks can modify the job’s attributes, change its routing, etc.

### 2.43.2.4 Caveats for Altering Jobs

When you lengthen the walltime of a running job, make sure that the new walltime will not interfere with any existing reservations etc.

### 2.43.3 Options to qalter

- **-a date_time**
  
  Changes the point in time after which the job is eligible for execution. Given in pairs of digits. Sets job’s Execution_Time attribute to date_time.

  Format: Datetime

  Each portion of the date defaults to the current date, as long as the next-smaller portion is in the future. For example, if today is the 3rd of the month and the specified day DD is the 5th, the month MM will be set to the current month.

  If a specified portion has already passed, the next-larger portion will be set to one after the current date. For example, if the day DD is not specified, but the hour hh is
specified to be 10:00 a.m. and the current time is 11:00 a.m., the day DD will be set to tomorrow.

The job’s Execution_Time attribute can be altered after the job has begun execution, in which case it will not take effect until the job is rerun.

-A account_string
Replaces the accounting string associated with the job. Used for labeling accounting data. Sets job’s Account_Name attribute to account_string. This attribute cannot be altered once the job has begun execution.

Format: String

-c checkpoint_spec
Changes when the job will be checkpointed. Sets job’s Checkpoint attribute. An $action script is required to checkpoint the job. This attribute can be altered after the job has begun execution, in which case the new value will not take effect until the job is rerun.

See the pbs_mom(8B) man page.

The argument checkpoint_spec can take on one of the following values:

  c
  Checkpoint at intervals, measured in CPU time, set on job’s execution queue. If no interval set at queue, job is not checkpointed

  c=<minutes of CPU time>
  Checkpoint at intervals of specified number of minutes of job CPU time. This value must be > 0. If interval specified is less than that set on job’s execution queue, queue’s interval is used.
  Format: Integer

  w
  Checkpoint at intervals, measured in walltime, set on job’s execution queue. If no interval set at queue, job is not checkpointed.

  w=<minutes of walltime>
  Checkpoint at intervals of the specified number of minutes of job walltime. This value must be greater than zero. If the interval specified is less than that set on the execution queue in which the job resides, the queue’s interval is used.
  Format: Integer

  n
  No checkpointing.

  s
  Checkpoint only when the server is shut down.
u
   Unset. Defaults to behavior when interval argument is set to s.
   Default: u.
   Format: String.
-e path
   Replaces the path to be used for the job’s standard error stream. Sets job’s
   Error_Path attribute to path.
   Format: [hostname:]path_name
   The path will be interpreted as follows:
   path_name
      If path_name is a relative path, then it is taken to be relative to the current work-
      ing directory of the qalter command, where it is executing on the current
      host.
      If path_name is an absolute path, then it is taken to be an absolute path on the
      current host where the qalter command is executing.
   hostname:path_name
      If path_name is a relative path, then it is taken to be relative to the user’s home
directory on the host named hostname.
      If path_name is an absolute path, then it is the absolute path on the host named
hostname.
      If path_name does not include a filename, the default filename will be
jobid.ER
   If the -e option is not specified, the default filename for the standard error stream is
   used.
   Format: job_name.esequence_number
   This attribute can be altered after the job has begun execution, in which case the new
   value will not take effect until the job is rerun.
   If you use a UNC path, the hostname is optional. If you use a non-UNC path, the
hostname is required.
-h hold_list

Updates the job’s hold list. Adds hold_list to the job’s Hold_Types attribute. The
hold_list is a string of one or more of the following:

Table 2-6: Hold Types

<table>
<thead>
<tr>
<th>Hold Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>Add a USER hold.</td>
</tr>
<tr>
<td>o</td>
<td>Add OTHER hold. Requires operator privilege.</td>
</tr>
<tr>
<td>n</td>
<td>Clear the holds for which the user has privilege.</td>
</tr>
</tbody>
</table>

This attribute can be altered after the job has begun execution, in which case the new
value will not take effect until the job is rerun.

-j join

Changes whether and how to join the job’s standard error and standard output
streams. Sets job’s Join_Path attribute to join.

Possible values of join:

Table 2-7: Join Path Options

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>oe</td>
<td>Standard error and standard output are merged into standard output.</td>
</tr>
<tr>
<td>eo</td>
<td>Standard error and standard output are merged into standard error.</td>
</tr>
<tr>
<td>n</td>
<td>Standard error and standard output are not merged.</td>
</tr>
</tbody>
</table>

This attribute can be altered after the job has begun execution, in which case the new
value will not take effect until the job is rerun.

Default: not merged.
Chapter 2  

**PBS Commands**

- **-k keep**
  Changes whether and which of the standard output and standard error streams will be retained on the execution host. Overrides default path names for these streams. Sets the job’s `Keep_Files` attribute to keep.
  The keep argument can take on the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>e</code></td>
<td>The standard error stream is retained on the execution host, in the job’s staging and execution directory. The filename will be: <code>job_name.e&lt;sequence number&gt;</code></td>
</tr>
<tr>
<td><code>o</code></td>
<td>The standard output stream is retained on the execution host, in the job’s staging and execution directory. The filename will be: <code>job_name.o&lt;sequence number&gt;</code></td>
</tr>
<tr>
<td><code>eo, oe</code></td>
<td>Both standard output and standard error streams are retained on the execution host, in the job’s staging and execution directory.</td>
</tr>
<tr>
<td><code>n</code></td>
<td>Neither stream is retained.</td>
</tr>
</tbody>
</table>

This attribute cannot be altered once the job has begun execution.

In the case where output and/or error is retained on the execution host in a job-specific staging and execution directory created by PBS, these files are deleted when PBS deletes the directory.

Default: neither is retained.

- **-l resource_arg**
  Allows the user to change requested resources and job placement. Sets job’s `Resource_list` attribute to `resource_arg`. Uses resource request syntax. Requesting a resource places a limit on its usage. Users without manager or operator privilege cannot alter a custom resource which was created to be invisible or read-only for users.
  Requesting resources in chunks:
  Format: `-l select=[N:]chunk+[N:]chunk ...`
  where N specifies how many of that chunk, and a chunk is:
  Format: `resource_name=value[:resource_name=value ...]`
  Requesting job-wide resources:
Format: `-l resource_name=value[,resource_name=value ...]`

The place statement can contain the following elements, in any order:

Format: `-l place=[ arrangement ][: sharing ][: grouping ]`

where

- `arrangement` is one of `free` | `pack` | `scatter` | `vscatter`
- `sharing` is one of `excl` | `shared` | `exchost`
- `grouping` can have only one instance of `group=resource`

and where

- `free`
  - Place job on any vnode(s).

- `pack`:
  - All chunks will be taken from one host.

- `scatter`:
  - Only one chunk with any MPI processes will be taken from a host. A chunk with no MPI processes may be taken from the same node as another chunk.

- `vscatter`:
  - Only one chunk is used in any vnode.

- `excl`:
  - Only this job uses the vnodes chosen.

- `exchost`:
  - The entire host is allocated to the job.

- `shared`:
  - This job can share the vnodes chosen.

- `group=resource`
Chapter 2

PBS Commands

Chunks will be grouped according to a resource. All nodes in the group must have a common value for the resource, which can be either the built-in resource host or a site-defined node-level resource.

If a requested modification to a resource would exceed the job’s queue’s limits, the resource request will be rejected. For a running job, resources may only be reduced. Which resources can be altered is system-dependent.

If the job was submitted with an explicit “-l select=”, then node level resources must be altered using the “-l select=” form. In this case a node level resource RES cannot be altered with the “-l RES” form.

The place statement cannot begin with a colon.

Examples:
1. Submit the job:
   
   ```
   % qsub -l select=1:ncpus=2:mem=512mb jobscript
   
   Job’s ID is 230
   ```

2. qalter the job using “-l RES” form:
   
   ```
   % qalter -l ncpus=4 230
   
   Error reported by qalter:
   ```

   ```
   qalter: Resource must only appear in “select” specification when select is used: ncpus 230
   ```

3. qalter the job using the “-l select=” form:
   
   ```
   % qalter -l select=1:ncpus=4:mem=512mb 230
   
   No error reported by qalter:
   ```

   ```
   
   ```

For more on resource requests, usage limits and job placement, see pbs_resources(7B).
PBS Commands

Chapter 2

-m mail_events
Changes the set of conditions under which mail about the job is sent. Sets job’s Mail_Points attribute to mail_events. The mail_events argument can be either “n” or any combination of “a”, “b”, and “e”.

Table 2-9: Mail Events Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>No mail will be sent.</td>
</tr>
<tr>
<td>a</td>
<td>Mail is sent when the job is aborted by the batch system.</td>
</tr>
<tr>
<td>b</td>
<td>Mail is sent when the job begins execution.</td>
</tr>
<tr>
<td>e</td>
<td>Mail is sent when the job terminates.</td>
</tr>
</tbody>
</table>

Format: String.
Default value: “a”.

-M user_list
Alters list of users to whom mail about the job is sent. Sets job’s Mail_Users attribute to user_list.
Format: user[@host][,user[@host],...]
Default: job owner.

-N name
Renames the job. Sets job’s Job_Name attribute to name.
Format: string, up to 236 characters in length. It must consist of an alphabetic character followed by printable, non-white-space characters.
Default: if a script is used to submit the job, the job’s name is the name of the script. If no script is used, the job’s name is “STDIN”.

-o path
Alters path to be used for the job’s standard output stream. Sets job’s Output_Path attribute to path.
Format: [hostname:]path_name
The path will be interpreted as follows:

path_name
If path_name is a relative path, then it is taken to be relative to the current working directory of the command, where it is executing on the current host.
Chapter 2  PBS Commands

If path_name is an absolute path, then it is taken to be an absolute path on the current host where the command is executing.

hostname:path_name

If path_name is a relative path, then it is taken to be relative to the user’s home directory on the host named hostname.

If path_name is an absolute path, then it is the absolute path on the host named hostname.

If path_name does not include a filename, the default filename will be jobid.OU

If the -o option is not specified, the default filename for the standard output stream is used. It has this form:

job_name.osequence_number

This attribute can be altered after the job has begun execution, in which case the new value will not take effect until the job is rerun.

If you use a UNC path, the hostname is optional. If you use a non-UNC path, the hostname is required.

-p priority

Alters priority of the job.

Sets job’s Priority attribute to priority.

This attribute can be altered after the job has begun execution, in which case the new value will not take effect until the job is rerun.

Format: host-dependent integer.

Range: [-1024, +1023] inclusive.

Default: zero.

-P project

Specifies a project for the job. Sets job's project attribute to specified value.

Format: String.

Project name can contain any characters except for the following: Slash (/), left bracket ([), right bracket (]), double quote (""), semicolon (;), colon (:), vertical bar (|), left angle bracket (<), right angle bracket (>), plus (+), comma (,), question mark (?), and asterisk (*).

Default value: "_pbs_project_default".
PBS Commands

Chapter 2

-`r y|n`
Changes whether the job is rerunnable. Sets job’s **Rerunnable** attribute to the argument. Does not affect how job is treated when the job was unable to begin execution.

See the `qrerun(1B)` command.

Format: single character, “y” or “n”.

<table>
<thead>
<tr>
<th>y</th>
<th>Job is rerunnable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Job is not rerunnable.</td>
</tr>
</tbody>
</table>

Default: “y”.

-S `path_list`
Specifies the interpreter or shell path for the job script. Sets job’s **Shell_Path_List** attribute to `path_list`.

The `path_list` argument is the full path to the interpreter or shell including the executable name.

Only one path may be specified without a host name. Only one path may be specified per named host. The path selected is the one whose host name is that of the server on which the job resides.

This attribute can be altered after the job has begun execution, but in this case the new value will not take effect until the job is rerun.

Format:

`path[@host][,path@host ...]`

Default: user’s login shell on execution node.

Example of using bash via a directive:

```
#PBS -S /bin/bash@mars,/usr/bin/bash@jupiter
```

Example of running a Python script from the command line on UNIX/Linux:

```
qsub -S $PBS_EXEC/bin/pbs_python <script name>
```

Example of running a Python script from the command line on Windows:

```
qsub -S %PBS_EXEC%\bin\pbs_python.exe <script name>
```

-u `user_list`
Alters list of usernames. Job will be run under a username from this list. Sets job’s **User_List** attribute to `user_list`.

Only one username may be specified without a host name. Only one username may be specified per named host. The server on which the job resides will select first the
username whose host name is the same as the server name. Failing that, the next selection will be the username with no specified hostname. The usernames on the server and execution hosts must be the same. The job owner must have authorization to run as the specified user.

This attribute cannot be altered once the job has begun execution.

Format: \texttt{user[@host][,user@host ...]}

Default: job owner (username on submit host.)

\textbf{-W additional\_attributes}

The \texttt{-W} option allows change in specification of additional job attributes.

Format: \texttt{-W attribute\_name = value[,attribute\_name=value...]}

If white space occurs within the \texttt{additional\_attributes} argument, or the equal sign ("=") occurs within an \texttt{attribute\_value} string, then that must be enclosed with single or double quotes. PBS supports the following attributes within the \texttt{-W} option:

\texttt{depend=dependency\_list}

Defines dependencies between this and other jobs. Sets the job’s \texttt{depend} attribute to \texttt{dependency\_list}. The dependency\_list has the form:

\texttt{type:arg\_list[type:arg\_list ...]}

where except for the \texttt{on} type, the \texttt{arg\_list} is one or more PBS job IDs in the form:

\texttt{jobid[jobid ...]}

The type can be:

\texttt{after: arg\_list}

This job may be scheduled for execution at any point after all jobs in \texttt{arg\_list} have started execution.

\texttt{afterok: arg\_list}

This job may be scheduled for execution only after all jobs in \texttt{arg\_list} have terminated with no errors. See section 2.43.6.1, “Warning About Exit Status with csh”, on page 149.

\texttt{afternotok: arg\_list}

This job may be scheduled for execution only after all jobs in \texttt{arg\_list} have terminated with errors. See section 2.43.6.1, “Warning About Exit Status with csh”, on page 149.

\texttt{afterany: arg\_list}

This job may be scheduled for execution after all jobs in \texttt{arg\_list} have terminated, with or without errors.
**before: arg_list**
Jobs in *arg_list* may begin execution once this job has begun execution.

**beforeok: arg_list**
Jobs in *arg_list* may begin execution once this job terminates without errors. See section 2.43.6.1, “Warning About Exit Status with csh”, on page 149.

**beforenotok: arg_list**
If this job terminates execution with errors, then jobs in *arg_list* may begin. See section 2.43.6.1, “Warning About Exit Status with csh”, on page 149.

**beforeany: arg_list**
Jobs in *arg_list* may begin execution once this job terminates execution, with or without errors.

**on: count**
This job may be scheduled for execution after *count* dependencies on other jobs have been satisfied. This type is used in conjunction with one of the **before** types listed. *count* is an integer greater than 0.

Restrictions:
Job IDs in the *arg_list* of **before** types must have been submitted with a type of **on**.

To use the **before** types, the user must have the authority to alter the jobs in *arg_list*. Otherwise, the dependency is rejected and the new job aborted.

Error processing of the existence, state, or condition of the job on which the newly-submitted job is a deferred service, i.e. the check is performed after the job is queued. If an error is detected, the new job will be deleted by the server. Mail will be sent to the job submitter stating the error.

Dependency examples:

```
qalter -W depend = afterok::123.host1.domain.com /tmp/script
qalter -W depend= before:234.host1.com:235.host1.com /tmp/script
```  

**group_list=g_list**
Alters list of group names. Job will be run under a group name from this list. Sets job's group_list attribute to g_list.

Only one group name may be specified without a host name. Only one group name may be specified per named host. The server on which the job resides will select first the group name whose host name is the same as the server name. Failing that, the next selection will be the group name with no specified hostname. The group names on the server and execution hosts must be the same.
Chapter 2  
PBS Commands

Format: `group[@host][,group@host ...]`
Default: login group name of job owner.

run_count=<value>
Sets the number of times the server thinks it has run the job. Sets the value of the job’s run_count attribute. Can be altered while job is running. Format: integer greater than or equal to zero.

sandbox=<value>
Changes which directory PBS uses for the job’s staging and execution.
Allowed values:

PRIVATE
PBS creates a job-specific directory for staging and execution.

HOME or unset
PBS uses the user’s home directory for staging and execution.

Format: String

stagein=path_list  
stageout=path_list
Changes files or directories to be staged-in before execution or staged-out after execution is complete. Sets the job’s stagein and stageout attributes to the specified path_lists. On completion of the job, all staged-in and staged-out files and directories are removed from the execution host(s). The path_list has the form:

`filespec[,filespec]`
where `filespec` is

`local_path@hostname:remote_path`
regardless of the direction of the copy. The name `local_path` is the name of the file or directory on the primary execution host. It can be relative to the staging and execution directory on the execution host, or it can be an absolute path.

The “@” character separates `local_path` from `remote_path`.
The name `remote_path` is the path on `hostname`. The name can be relative to the staging and execution directory on the primary execution host, or it can be an absolute path.

If `path_list` has more than one `filespec`, i.e. it contains commas, it must be enclosed in double-quotes.

If you use a UNC path, the hostname is optional. If you use a non-UNC path, the hostname is required.
**PBS Commands**

---

**umask=NNNN**

Alters the umask with which the job will be started. Controls umask of job’s standard output and standard error. Sets job’s `umask` attribute to `NNNN`. Can be used with one to four digits; typically two.

The following example allows group and world read on the job’s output:

```
-W umask=33
```

Default value: `077`

**--version**

The `qalter` command returns its PBS version information and exits. This option can only be used alone.

---

### 2.43.4 Operands

The `qalter` command accepts a `job_identifier_list` as its operand. The `job_identifier_list` is one or more job IDs for normal jobs or array jobs. Individual subjobs of an array job are not alterable.

Note that some shells require that you enclose a job array ID in double quotes.

---

### 2.43.5 Standard Error

The `qalter` command will write a diagnostic message to standard error for each error occurrence.

---

### 2.43.6 Exit Status

Zero upon successful processing of input. Exit value will be greater than zero upon failure of `qalter`.

---

#### 2.43.6.1 Warning About Exit Status with csh

If a job is run in `csh` and a `.logout` file exists in the home directory in which the job executes, the exit status of the job is that of the `.logout` script, not the job script. This may impact any inter-job dependencies.

2.44  qdel

Deletes PBS jobs

2.44.1  Synopsis

qdel [-x] [-Wforce] [-Wsuppress_email=<N>] job_identifier [job_identifier ...]
qdel --version

2.44.2  Description

The qdel command deletes jobs in the order given, whether they are at the local server or at a remote server.

The qdel command is used without options to delete queued, running, held, or suspended jobs, while the -x option gives it the additional capacity to delete finished or moved jobs. With the -x option, this command can be used on finished and moved jobs, in addition to queued, running, held, or suspended jobs.

When this command is used without the -x option, if job history is enabled, the deleted job’s history is retained. The -x option is used to additionally remove the history of the job being deleted.

A PBS job may be deleted by its owner, an operator, or the administrator. The server deletes a PBS job by sending a SIGTERM signal, then, if there are remaining processes, a SIGKILL signal.

If someone other than the job’s owner deletes the job, mail is sent to the job’s owner, or to a list of mail recipients if specified during qsub. See the qsub(1B) man page.
2.44.2.1 How Behavior of qdel Command Can Be Affected

The server's default_qdel_arguments attribute may affect the behavior of the qdel command. This attribute is settable by the administrator via the qmgr command. The attribute may be set to "-W suppress_email=<N>". The server attribute is overridden by command line arguments. See section 6.6, “Server Attributes”, on page 332.

If the job is in the process of provisioning, it can be deleted only by using the -W force option.

2.44.2.2 Sequence of Events

1. The job's running processes are killed.
2. The epilogue runs.
3. Files that were staged in are staged out. This includes
4. standard out (.o) and standard error (.e) files.
5. Files that were staged in or out are deleted.
6. The job's temp directory is removed.
7. The job is removed from the MoM(s) and the server.

2.44.3 Options to qdel

(no options)
Can delete queued, running, held, or suspended jobs. Does not delete job history for specified job(s).

-W force
Deletes the job whether or not the job’s execution host is reachable. Deletes the job whether or not the job is in the process of provisioning. Cannot be used with the -W suppress_email option.

-W suppress_email=<N>
Sets limit on number of emails sent when deleting multiple jobs or subjobs. If N >= 1 and N or more job_identifiers are given, N emails are sent. If N > 1 and less than
N job identifiers are given, the number of emails is the same as the number of jobs. If \( N = 0 \), this option is ignored. If \( N = -1 \), no mail is sent.

Note that there is no space between “W” and “suppress_email”.

The \(<N>\) argument is an integer.

Cannot be used with -Wforce option.

-\(x\)
Can delete running, queued, suspended, held, finished, or moved jobs. Deletes job history for the specified job(s).

--version
The qdel command returns its PBS version information and exits. This option can only be used alone.

2.44.4 Operands

The qdel command accepts one or more job_identifier operands. These operands can be job identifiers, job array identifiers, job array range identifiers, or subjob identifiers. See Chapter 7, "Formats", on page 421.

Job array identifiers must be enclosed in double quotes for some shells.

2.44.5 Standard Error

The qdel command writes a diagnostic message to standard error for each error occurrence.

2.44.6 Exit Status

Zero upon successful processing of input.

Greater than zero upon error.

2.44.7 See Also

2.45 qdisable

Prevents jobs from being enqueued in a queue

2.45.1 Synopsis

qdisable destination ...
qdisable --version

2.45.2 Description

The qdisable command directs that a destination queue should no longer accept batch jobs. If the command is accepted, the queue will no longer accept Queue Job requests which specified the disabled queue. Jobs which already reside in the queue will continue to be processed. This allows a queue to be “drained.”

In order to execute qdisable, the user must have PBS Operator or Manager privilege.

2.45.3 Options

--version

The qdisable command returns its PBS version information and exits. This option can only be used alone.

2.45.4 Operands

The qdisable command accepts one or more destination operands. The operands take one of three forms:

queue
@server
queue@server

If queue is specified, the request is to disable that queue at the default server. If the @server form is given, the request is to disable all the queues at that server. If a full destination identifier, queue@server, is given, the request is to disable the named queue at the named server.
2.45.5 Standard Error

The `qdisable` command will write a diagnostic message to standard error for each error occurrence.

2.45.6 Exit Status

Upon successful processing of all the operands presented to the `qdisable` command, the exit status will be a value of zero.

If the `qdisable` command fails to process any operand, the command exits with a value greater than zero.

2.45.7 See Also

2.46 `qenable`

Allow jobs to be enqueued in a queue

2.46.1 Synopsis

```
qenable destination ...
quenable --version
```

2.46.2 Description

The `qenable` command directs that a destination queue should accept batch jobs.

The `qenable` command sends a Manage request to the batch server specified by queue. If the command is accepted, the destination will accept Queue Job requests which specified the queue.

In order to execute `qenable`, the user must have PBS Operator or Manager privilege.
2.46.3 Options

--version

The `qenable` command returns its PBS version information and exits. This option can only be used alone.

2.46.4 Operands

The `qenable` command accepts one or more destination operands. The operands are one of three forms:

- `queue`
- `@server`
- `queue@server`

If `queue` is specified, the request is to enable that queue at the default server. If the `@server` form is given, the request is to enable all the queues at that server. If a full destination identifier, `queue@server`, is given, the request is to enable the named queue at the named server.

2.46.5 Standard Error

The `qenable` command will write a diagnostic message to standard error for each error occurrence.

2.46.6 Exit Status

Upon successful processing of all the operands presented to the `qenable` command, the exit status will be a value of zero.

If the `qenable` command fails to process any operand, the command exits with a value greater than zero.

- `pbs_server(8B)`, `qdisable(8B)`, and `qmgr(8B)`

2.47 qhold

Holds PBS batch jobs
Chapter 2  

PBS Commands

2.47.1  Synopsis

qhold [-h hold_list] job_identifier_list
qhold --version

2.47.2  Description

The qhold command requests that a server place one or more holds on a job. A job that has
a hold is not eligible for execution. Supported holds: USER, OTHER (also known as operator), SYSTEM, and bad password.

A user may place a USER hold upon any job the user owns. An operator, who is a user with
operator privilege, may place either a USER hold or an OTHER hold on any job. The batch
administrator may place any hold on any job.

The p option can only be set by root or admin user via qhold -h p. The owning user can
release with qrls -h p or query by qselect -h p.

If no -h option is given, the USER hold will be applied to the jobs described by the
job_identifier_list operand list.

If the job identified by job_identifier_list is in the queued, held, or waiting states, then all that
occurs is that the hold type is added to the job. The job is then placed into the held state if it
resides in an execution queue.

If the job is running, then the result of the qhold command depends upon whether the job
can be checkpointed. The job can be checkpointed if the OS supports checkpointing, or if the
application being checkpointed supports checkpointing. See the PBS Professional Adminis-
trator’s Guide. If the job can be checkpointed, the following happens:
  • The job is checkpointed and its execution is interrupted.
  • The resources assigned to the job are released.
  • The job is placed in the held state in the execution queue.
  • The job’s Hold_Types attribute is set to u for User Hold.

If checkpoint / restart is not supported, qhold simply sets the job’s Hold_Types attribute to
u. The job continues to execute.

A job’s dependency places a system hold on the job. When the dependency is satisfied, the
system hold is removed. This system hold is the same as the one set by an administrator. If
the administrator sets a system hold on a job with a dependency, then when the dependency is
satisfied, the job becomes eligible for execution.

The qhold command can be used on job arrays, but not on subjobs or ranges of subjobs.
If the job is in the process of provisioning, it cannot be held.
2.47.3 Options to qhold

-\( h \) hold_list
  Defines the types of holds to be placed on the job.
  The hold_list argument is a string consisting of one or more of the letters “u”, “o”, or “s” in any combination or the character “n” or “p”. The hold type associated with each letter is:

<table>
<thead>
<tr>
<th>Hold Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>USER</td>
</tr>
<tr>
<td>o</td>
<td>OTHER</td>
</tr>
<tr>
<td>s</td>
<td>SYSTEM</td>
</tr>
<tr>
<td>n</td>
<td>None</td>
</tr>
<tr>
<td>p</td>
<td>Bad password</td>
</tr>
</tbody>
</table>

--version
  The qhold command returns its PBS version information and exits. This option can only be used alone.

2.47.4 Operands

The qhold command accepts a job_identifier_list which is one or more space-separated job IDs in the form:

sequence_number[.server_name][@server]

Note that some shells require that you enclose a job array identifier in double quotes.

2.47.5 Standard Error

The qhold command will write a diagnostic message to standard error for each error occurrence.
2.47.6 Exit Status

Zero upon successful processing of all the operands.
Greater than zero if the qhold command fails to process any operand.

2.47.7 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, qrls(1B), qalter(1B), qsub(1B), pbs_alterjob(3B), pbs_holdjob(3B), pbs_rlsjob(3B), pbs_job_attributes(7B), pbs_resources(7B)

2.48 qmgr

Administrator’s command interface for managing PBS

2.48.1 Synopsis

qmgr [-a] [-c directive] [-e] [-n] [-z] [server [server]...]
qmgr --version

2.48.2 Description

The PBS manager command, qmgr, provides a command-line interface to parts of PBS. The qmgr command is used to create or delete queues, vnodes, resources, and hooks, to set or change vnode, queue, hook, server, or scheduler attributes and resources, and to view information about hooks, queues, vnodes, resource definitions, the server, and the scheduler.

For information about attributes, see Chapter 6, "Attributes", on page 327.

For information about resources, see "PBS Resources" on page 305 in the PBS Professional Administrator’s Guide.

Attributes whose values are unset do not appear in the output of the qmgr command.

Definitions for built-in resources do not appear in the output of the qmgr command.

If qmgr is invoked without the -c option and standard output is connected to a terminal, qmgr writes a prompt to standard output and reads a directive from standard input. See section 2.48.4.1, "Directive Syntax", on page 161.
For a `qmgr` prompt, type:

```
qmgr <return>
```

For a list of quick summaries of information about syntax, commands, attributes, operators, names, and values, type “help” or “?” at the `qmgr` prompt. See section 2.48.6.14, “Printing Usage Information”, on page 182.

### 2.48.2.1 Required Privilege

The `qmgr` command requires different levels of privilege depending on the operation to be performed. All users can list or print attributes except for hook attributes. PBS Operator or Manager privilege is required in order to set or change vnode, queue, hook, server, or scheduler attributes. PBS Manager privilege is required in order to create or delete queues, vnodes, resources, and hooks.

Under UNIX/Linux, root privilege is required in order to operate on hooks or the `job_sort_formula` server attribute. Under Windows, this must be done from the installation account. For domained environments, the installation account must be a local account that is a member of the local Administrators group on the local computer. For standalone environments, the installation account must be a local account that is a member of the local Administrators group on the local computer.

Users without manager or operator privilege cannot view custom resources or resource definitions which were created to be invisible to users.

### 2.48.2.2 When To Run `qmgr` At Server Host

When operating on hooks or on the `job_sort_formula` server attribute, the `qmgr` command must be run at the server host.

### 2.48.2.3 Reusing and Editing the `qmgr` Command Line

You can reuse or edit `qmgr` command lines. The `qmgr` command maintains a history of commands entered, up to a maximum of 500. You can use the ‘history’ command to see a numbered list of commands, and the `!n` command to execute the line whose number is `n`. You must not put any spaces between the bang (“!”) and the number. For example, to execute the 123rd command, type the following:

```
!123
```

You can see the last `m` commands by typing `history m`. For example, to see the last 6 commands, type the following:

```
history 6
```

---

**PBS Professional 13.0 Reference Guide**

**RG-159**
Chapter 2  

PBS Commands

You can use the up and down arrows to navigate through the command history list, and the left and right arrows to navigate within a command line. Within a command line, you can use emacs commands to move forward and backward, and delete characters.

You can edit the qmgr command line using the backspace and delete keys, and you can insert characters anywhere in a command line.

History is maintained across qmgr sessions, so that if you start qmgr, then exit, then restart it, you can reuse your commands from the previous session. If you exit qmgr and then restart it, the command lines are renumbered.

If you enter the same command line more than once in a row, only one occurrence is recorded in the history. If you enter the same command line multiple times, but intersperse other command lines after each line, each occurrence is recorded.

Each user’s history is unique to that user on that host.

In the case where an account runs concurrent sessions, the most recent logout of a session overwrites history from previous logouts. For example, if two people are both logged in as root and using qmgr, the second person to log out overwrites the history file.

2.48.2.3.i  The qmgr History File

The qmgr command stores and retrieves its history. First, it tries to write its history in the ${HOME}/.pbs_qmgr_history file. If this file or directory location is not writable, the command stores its history in $PBS_HOME/spool/.pbs_qmgr_history_<username>. If this file is also not writable, the following happens:

- The qmgr command prints error messages once at qmgr startup
- The qmgr command cannot provide history across qmgr sessions

2.48.3  Options to qmgr

The following table lists the options to qmgr:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>-a</td>
<td>Abort qmgr on any syntax errors or any requests rejected by a server.</td>
</tr>
<tr>
<td>-c directive</td>
<td>Execute a single command (directive) and exit qmgr. The directive must be enclosed in quote marks, e.g. qmgr -c &quot;print server&quot;</td>
</tr>
</tbody>
</table>
A qmgr directive is a command together with the object to be operated on, the attribute belonging to the object that is to be changed, the operator, and the value the attribute will take. In the case of resources, you can set the type and/or flag(s).

A directive is terminated by a newline or a semicolon (“;”). Multiple directives may be entered on a single line. A directive may extend across lines by escaping the newline with a backslash ("\").

### Directive Syntax

A qmgr directive takes one of the following forms:

- `command <object type> [object names] [attribute OP value[,attribute OP value,...]]`
- `command resource [resource names] [type = <type>],[,flag = <flag(s)>]`
- `import hook <hook_name> application/x-python <content-encoding> {<input_file>|-}`
- `export hook <hook_name> <content-type> <content-encoding> [<output_file>]`
- `import hook <hook_name> application/x-config <content-encoding> {<input_file>|-}

The directive can be used from the command line or from within the qmgr command. To use a directive from the command line, enclose the command and its arguments in single or double quotes. For example:

```
qmgr -c 'print queue Q1'
```
To use a directive from within the `qmgr` command, first start `qmgr`:

```
qmgr <return>
```

At the `qmgr` prompt, enter the command and its arguments. For example:

```
qmgr: print queue Q1
```

Each command is explained in the following subsections.

### 2.48.4.2 Comments

Comments begin with the “#” character and continue to the end of the line. Comments and blank lines are ignored by `qmgr`.

### 2.48.5 Arguments to Commands

#### 2.48.5.1 Objects

The `qmgr` command can operate on servers, schedulers, queues, vnodes, hooks, resources, and built-in hooks. Each of these can be abbreviated in a directive. The following table lists the objects and their abbreviations:

<table>
<thead>
<tr>
<th>Object Name</th>
<th>Abbr</th>
<th>Object Definition</th>
<th>Can be Created/Deleted By:</th>
<th>Can be Modified By:</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>s</td>
<td>A server</td>
<td>No one</td>
<td>Operator, Manager</td>
</tr>
<tr>
<td>queue</td>
<td>q</td>
<td>A queue</td>
<td>Operator, Manager</td>
<td>Operator, Manager</td>
</tr>
<tr>
<td>node</td>
<td>n</td>
<td>A vnode</td>
<td>Operator, Manager</td>
<td>Operator, Manager</td>
</tr>
<tr>
<td>hook</td>
<td>h</td>
<td>A hook</td>
<td>UNIX/Linux: root; Windows: installation account</td>
<td>UNIX/Linux: root; Windows: installation account</td>
</tr>
<tr>
<td>pbshook</td>
<td>p</td>
<td>A built-in hook</td>
<td>No one</td>
<td>UNIX/Linux: root; Windows: installation account</td>
</tr>
<tr>
<td>resource</td>
<td>r</td>
<td>A resource</td>
<td>Manager</td>
<td>Manager</td>
</tr>
<tr>
<td>sched</td>
<td>sc</td>
<td>A scheduler</td>
<td>No one</td>
<td>Operator, Manager</td>
</tr>
</tbody>
</table>

RG-162

PBS Professional 13.0 Reference Guide
2.48.5.2 Specifying Server

The `qmgr` command operates on objects (queues, vnodes, etc.) at the active server. There is always at least one active server; the default server is the active server unless other servers have been made active.

The default server is the server managing the host where the `qmgr` command runs, meaning it is the server specified in that host’s `pbs.conf` file.

You can specify the server you want:

@default
   Specifies the default server.
@<server name>
   Specifies a named server.
@active
   Specifies all active servers.

Server names have the following format:

hostname[:port]

where `hostname` is the fully-qualified domain name of the host on which the server is running and `port` is the port number to which to connect. If `port` is not specified, the default port number is used.

2.48.5.3 Object Names

In a `qmgr` directive, `object names` is a list of one or more names of specific objects. All objects in a list must be of the same type. The name list is in the form:

<object name>[@<server>][,<object name>[@<server>] ...]

where `<server>` is replaced in the directive with “default”, “active”, or “<server name>”.

There must be no space between the name and the @ sign.

The administrator specifies the name of an object when creating the object.
Node attributes cannot be used as node names.

Example 2-4: List queues workq, slowq, and fastq at the active server:

```
Qmgr: list queue workq,slowq,fastq
```

Example 2-5: List queues Queue1 at the default server, Queue2 at Server2, and Queue3 at the active server:

```
Qmgr: list queue Queue1@default,Queue2@Server2,Queue3@active
```

Name lists must not contain white space between entries.

2.48.5.4 Specifying Objects

You can specify objects in the following ways:

```
<object type>
```

Acts on the active objects of the named type at the active server.

For example, to list all active vnodes, along with their attributes, at the active server:

```
list node
```

```
<object type> @<server>  (note space before @ sign)
```

Acts on the active objects of the named type at the specified server.

For example, to list all active vnodes at the default server, along with their attributes:

```
list node @default
```

For example, to print out all queues at the default server, along with their attributes:

```
qmgr -c “print queue @default”
```

```
<object type> <object name>
```

Acts on the named object.

For example, to list Node1 and its attributes:

```
list node Node1
```

```
<object type> <object name>@<server>
```

Acts on the named object at the specified server.

For example, to list Node1 at the default server, along with the attributes of Node1:

```
list node Node1@default
```
2.48.5.5 Attributes

In a `qmgr` directive, `attribute` is the name of the attribute belonging to the object on which `qmgr` is to operate. You can set or modify the value of this attribute.

If the attribute is one which describes a set of resources, then the attribute is specified in the form:

`attribute.<resource name>`

For example, to set the amount of memory on a vnode:

```
Qmgr: set node Vnode1 resources_available.mem = 2mb
```

Any attribute value set via `qmgr` containing commas, whitespace or the hashmark must be enclosed in double quotes. For example:

```
Qmgr: set node Vnode1 comment="Node will be taken offline Friday at 1:00 for memory upgrade."
```
2.48.5.6 Operators

In a `qmgr` directive, `OP` is the operation to be performed with the attribute and its value. Operators are listed here:

**Example 2-6:** Set routing destination for queue Queue1 to be Dest1:

```
Qmgr: set queue route_destinations = Dest1
```

**Example 2-7:** Add new routing destination for queue Queue1:

```
Qmgr: set queue route_destinations += Dest2
```

**Example 2-8:** Remove new routing destination for queue Queue1:

```
Qmgr: set queue route_destinations -= Dest2
```

When setting resource definition values, you can use only the equal sign ("=").

<table>
<thead>
<tr>
<th>Operator</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Sets the value of the attribute. If the attribute has an existing value, the current value is replaced with the new value.</td>
</tr>
<tr>
<td>+=</td>
<td>Increases the current value of the attribute by the amount in the new value. When used for a string array, adds the new value as another string after a comma.</td>
</tr>
<tr>
<td>-=</td>
<td>Decreases the current value of the attribute by the amount in the new value. When used for a string array, removes the first matching string.</td>
</tr>
</tbody>
</table>

**Table 2-13: Operators**

Example 2-6: Set routing destination for queue Queue1 to be Dest1:

```
Qmgr: set queue route_destinations = Dest1
```

Example 2-7: Add new routing destination for queue Queue1:

```
Qmgr: set queue route_destinations += Dest2
```

Example 2-8: Remove new routing destination for queue Queue1:

```
Qmgr: set queue route_destinations -= Dest2
```

When setting resource definition values, you can use only the equal sign ("=").

2.48.5.7 Attribute Values

In a `qmgr` directive, `value` is the value to assign to an attribute. An attribute’s value must be in the correct format for the attribute’s type. Each attribute’s type is listed in [Chapter 6, "Attributes", on page 327](#). Each format is described in [Chapter 7, "Formats", on page 421](#).

If the value includes whitespace, commas or other special characters, such as the # character, the value string must be enclosed in single or double quotes.

Resource values can be any string made up of alphanumeric, comma (",") underscore ("_"), dash ("-"), colon (":") slash ("/"), backslash ("\"), space (" "), and equal sign ("=") characters.
2.48.5.8 Windows Requirements

Under Windows, use double quotes when specifying arguments to \texttt{qmgr}. For example:

\begin{verbatim}
qmgr: import hook hook1 application/x-python default "\Documents and Settings\pbsuser1\hook1.py"
\end{verbatim}

or

\begin{verbatim}
qmgr -c 'import hook hook1 application/x-python default "\Documents and Settings\pbsuser1\hook1.py"'
\end{verbatim}

2.48.6 Commands

The \texttt{qmgr} commands can be used in two ways. One is to start \texttt{qmgr}, then use directives at the \texttt{qmgr} prompt. For example, type:

\begin{verbatim}
qmgr <return>
\end{verbatim}

The \texttt{qmgr} prompt appears:

\begin{verbatim}
qmgr:
\end{verbatim}

Now you can enter commands, using directives, for example:

\begin{verbatim}
qmgr: print server
\end{verbatim}

The other is to call \texttt{qmgr} with the -c option and a directive in quotes. For example, to enter the same "\texttt{print server}" directive:

\begin{verbatim}
qmgr -c "print server"
\end{verbatim}

Commands can be abbreviated to their minimum unambiguous form. Commands apply to all objects unless explicitly limited. The following table lists the commands, briefly tells what they do, and gives a link to a full description:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|l|}
\hline
\textbf{Command} & \textbf{Abbr} & \textbf{Effect} & \textbf{Description} \\
\hline
active & a & Specifies active objects & See section 2.48.6.1, “Making Objects Active”, on page 168 \\
create & c & Creates object & See section 2.48.6.2, “Creating Objects”, on page 171 \\
delete & d & Deletes object & See section 2.48.6.3, “Deleting Objects”, on page 172 \\
\hline
\end{tabular}
\end{table}
Making objects active is a way to set up a list of objects, all of the same type, on which you can then use a single command. Can be used on any object except resources or hooks. For example, if you are going to set the same attribute to the same value on several vnodes, you can make all of the target vnodes active before using a single command to set the attribute value, instead of having to give the command once for each vnode.

When an object is active, it is acted upon when you specify its type but do not specify names. When you specify any object names in a directive, active objects are not operated on unless they are named in the directive.
You can specify a list of active objects for each type of object. You can have active objects of multiple types at the same time. The active objects of one type have no effect on whether objects of another type are active.

Objects are active only until the `qmgr` command is exited, so this feature can be used only at the `qmgr` prompt.

Each time you make any objects active, that list of objects replaces any active objects of the same kind. For example, if you have four queues, and you make Q1 and Q2 active, then later make Q3 and Q4 active, the result is that Q3 and Q4 are the only active queues.

You can make objects be active at different servers simultaneously. For example, you can set vnodes N1 and N2 at the default server, and vnodes N3 and N4 at server Server2 to be active at the same time.

To make all objects inactive, quit `qmgr`. When you quit `qmgr`, any object that was active is no longer active.
2.48.6.1.i Using the active Command

`active <object type> [,<object name> ...]`  

Makes the named object(s) of the specified type active.

Example: To make queue Queue1 active:

```
Qmgr: active queue Queue1
```

Example: To make queues Queue1 and Queue2 at the active server be active, then enable them:

```
Qmgr: active queue Queue1,Queue2
Qmgr: set queue enabled=True
```

Example: To make queue Queue1 at the default server and queue Queue2 at Server2 be active:

```
Qmgr: active queue Queue1@default,Queue2@Server2
```

Example: To make vnodes N1, N2, N3, and N4 active, and then give them all the same value for their `max_running` attribute:

```
Qmgr: active node N1,N2,N3,N4
Qmgr: set node max_running = 2
```

`active <object type> @<server>`  (note space before @ sign)

Makes all object(s) of the specified type at the specified server active.

Example: To make all queues at the default server active:

```
Qmgr: active queue @default
```

Example: To make all vnodes at server Server2 active:

```
Qmgr: active node @Server2
```

`active <object type>`

Queries which objects of the specified type are active. The `qmgr` command prints a list of names of active objects of the specified type to stdout.
2.48.6.2 Creating Objects

`create <object type> <object name>[.<object name> ...] [[attribute = value] [attribute = value] ...]`

Creates one new object of the specified type for each name, and gives it the specified name. Can be used only with queues, vnodes, resources, and hooks. Cannot be used with pbshooks (built-in hooks).

For example, to create a queue named Q1 at the active server:

```bash
Qmgr: create queue Q1
```

For example, to create a vnode named N1 and a vnode named N2:

```bash
Qmgr: create node N1,N2
```

For example, to create queue Queue1 at the default server and queue Queue2 at Server2:

```bash
Qmgr: create queue Queue1@default,Queue2@Server2
```

For example, to create vnodes named N1, N2, N3, and N4 at the active server, and to set their `Mom` attribute to `Host1` and their `max_running` attribute to 1:

```bash
Qmgr: create node N1,N2,N3,N4 Mom=Host1, max_running = 1
```

To create a host-level consumable custom string resource named “foo”:

```bash
qmgr -c "create resource foo type=string,flag=nh"
```

All objects of the same type at a server must have unique names. For example, each queue at server Server1 must have a unique name. Objects at one server can have the same name as objects at another server.

You can create multiple objects of the same type with a single command. You cannot create multiple types of objects in a single command.

For example, to create multiple resources of the same type and flag, separate each resource name with a comma:

```bash
qmgr -c "create resource r1,r2 type=long,flag=nh"
```
2.48.6.3 Deleting Objects

delete <object type> <object name>[,<object name> ...]

Deletes the named object(s). Can be used only with queues, vnodes, resources, and hooks. Cannot be used with built-in hooks.

For example, to delete queue Q1 at the active server:

Qmgr: delete queue Q1

For example, to delete vnodes N1 and N2 at the active server:

Qmgr: delete node N1,N2

For example, to delete queue Queue1 at the default server and queue Queue2 at Server2:

Qmgr: delete queue Queue1@default,Queue2@Server2

For example, to delete resource “foo” at the active server:

Qmgr: delete resource foo

delete <object type>

Deletes the active objects of the specified type. For example, to delete the active queues:

Qmgr: delete queue

delete <object type> @<server>

Deletes the active objects of the specified type at the specified server. For example, to delete the active queues at server Server2:

Qmgr: delete queue @Server2

You can delete multiple objects of the same type with a single command. You cannot delete multiple types of objects in a single command.

For example, to delete multiple resources, separate the resource names with commas:

Qmgr: delete resource r1, r2

You cannot delete a custom resource that is requested by a job or reservation, or that is set on a server, queue, or vnode.

2.48.6.4 Exporting Hooks

For exporting the contents of a hook. Cannot be used with pbshooks.

Format for exporting a hook:

export hook <hook name> <content-type> <content-encoding> [<output_file>]

RG-172

PBS Professional 13.0 Reference Guide
This dumps the script contents of hook `<hook_name>` into `<output_file>`, or `stdout` if `<output_file>` is not specified.

- The resulting `<output_file>` or `stdout` data is of `<content-type>` and `<content-encoding>`.
- The only `<content-type>` currently supported is “application/x-python”.
- The allowed values for `<content-encoding>` are “default” (7bit) and “base64”.
- `<output_file>` must be a path that can be created by `qmgr`.
- Any relative path `<output_file>` is relative to the directory where `qmgr` was executed.
- If `<output_file>` already exists it is overwritten. If PBS is unable to overwrite the file due to ownership or permission problems, then an error message is displayed in `stderr`.
- If the `<output_file>` name contains spaces like the ones used in Windows file names, then `<output_file>` must be enclosed in quotes.

Example 2-9: Dumps hook1’s script contents directly into a file "hello.py.out":

```bash
# qmgr -c 'export hook hook1 application/x-python default hello.py'
# cat hello.py
import pbs
pbs.event().job.comment="Hello, world"
```

Example 2-10: To dump the script contents of a hook 'hook1' into a file in “\My Hooks\hook1.py”:

```bash
Qmgr: export hook hook1 application/x-python default "\My Hooks\hook1.py"
```

### 2.48.6.5 Importing Hooks

For importing the contents of a hook. Cannot be used with pbshooks.

To import a hook, you import the contents of a hook script into the hook. You must specify a filename that is locally accessible to `qmgr` and the PBS server.

Format for importing a hook:

```
import hook <hook name> application/x-python <content-encoding> {<input_file>|
```
This uses the contents of `<input_file>` or `stdin` (-) as the contents of hook `<hook_name>`.

- The `<input_file>` or `stdin` (-) data must have a format `<content-type>` and must be encoded with `<content-encoding>`.
- The allowed values for `<content-encoding>` are “default” (7bit) and “base64”.
- If the source of input is `stdin` (-) and `<content-encoding>` is “default”, then `qmgr` expects the input data to be terminated by EOF.
- If the source of input is `stdin` (-) and `<content-encoding>` is “base64”, then `qmgr` expects input data to be terminated by a blank line.
- `<input_file>` must be locally accessible to both `qmgr` and the requested batch server.
- A relative path `<input_file>` is relative to the directory where `qmgr` was executed.
- If a hook already has a content script, then that is overwritten by this import call.
- If `<input_file>` name contains spaces as are used in Windows filenames, then `<input_file>` must be quoted.
- There is no restriction on the size of the hook script.

Example 2-11: Given a Python script in ASCII text file "hello.py", this makes its contents be the script contents of hook1:

```
# cat hello.py
import pbs
pbs.event().job.comment="Hello, world"
# qmgr -c 'import hook hook1 application/x-python default hello.py'
```

Example 2-12: Given a base64-encoded file "hello.py.b64", `qmgr` unencodes the file's contents, and then makes this the script contents of hook1:

```
# cat hello.py.b64
chJpbnQgImhlbGxvLCB3b3JsZCIK
# qmgr -c 'import hook hook1 application/x-python base64 hello.py.b64'
```

### 2.48.6.6 Importing Hook Configuration Files

For importing the contents of a hook configuration file.

To import a hook configuration file, you import the contents of a file to a hook. You must specify a filename that is locally accessible to `qmgr` and the PBS server.

Format for importing a hook configuration file:

```
import hook <hook name> application/x-config <content-encoding> {<config_file>|-}
```
This uses the contents of `<config_file>` or `stdin (-)` as the contents of configuration file for hook `<hook_name>`.

- The `<config_file>` or `stdin (-)` data must have a format `<content-type>` and must be encoded with `<content-encoding>`.
- The allowed values for `<content-encoding>` are “default” (7bit) and “base64”.
- If the source of input is `stdin (-)` and `<content-encoding>` is “default”, then `qmgr` expects the input data to be terminated by EOF.
- If the source of input is `stdin (-)` and `<content-encoding>` is “base64”, then `qmgr` expects input data to be terminated by a blank line.
- `<config_file>` must be locally accessible to both `qmgr` and the requested batch server.
- A relative path `<config_file>` is relative to the directory where `qmgr` was executed.
- If a hook already has a configuration file, then that is overwritten by this import call.
- If `<config_file>` name contains spaces as are used in Windows filenames, then `<input file>` must be quoted.
- There is no restriction on the size of the hook configuration file.

2.48.6.6.i Hook Configuration File Format

PBS supports several file formats for configuration files. The format of the file is specified in its suffix. Formats can be specified in any of the following ways:

- `.ini`
- `.json`
- `.py` (Python)
- `.txt` (generic, no special format)
- `.xml`
- No suffix: treat the input file as if it is a `.txt` file
- The dash (-) symbol: configuration file content will be taken from `STDIN`. The content is treated as if it is a `.txt` file.

For example, to import a configuration file in `.json` format:

```
# qmgr -c "import hook <hook_name> application/x-config default
input_file.json"
```
2.48.6.7 Setting Attribute Values

You can use the qmgr command to set attributes of any object, except for the type attribute of a built-in hook.

```
set <object type> <object name>[,<object name> ...] attribute = value [,attribute = value ...
```

Sets the value of the specified attribute(s) for the named object(s). Each specified attribute is set for each named object, so if you specify three attributes and two objects, both objects get all three attributes set.

```
set <object type> attribute = value
```

Sets the attribute value for all active objects when there are active objects of the type specified.

```
set <object type> @<server> attribute = value
```

Sets the attribute value for all active objects at the specified server when there are active objects of the type specified.

You can have spaces between attribute-value pairs.

If a value contains a space or a comma, the value must be enclosed in single or double quotes. For example, to set the value of vnode N1’s comment to “Check later, replacing memory”:

```
Qmgr: set node N1 comment = "Check later, replacing memory"
```

You can set attribute values for only one type of object in each command.

2.48.6.8 Unsetting Attribute Values

You can use the qmgr command to unset attributes of any object, except for the type attribute of a pbshook.

```
unset <object type> <object name>[,<object name> ...] attribute[,attribute...]
```

Unsets the value of the specified attributes of the named object(s).

```
unset <object type> attribute[,attribute...]
```

Unsets the value of specified attributes of active objects.

```
unset <object type> <object name> attribute[,attribute...]
```

Unsets the value of specified attributes of the named object.

```
unset <object type> @<server> attribute[,attribute...]
```

Unsets the value of specified attributes of active objects at the specified server.

You can have spaces between attribute names.
You can unset attribute values for only one type of object in each command.

### Setting Custom Resource Type and Flag(s)

2.48.6.9

You can use the `qmgr` command to set the type and flag(s) for custom resources. Resource type can be:

- `string`
- `boolean`
- `string_array`
- `long`
- `size`
- `float`

Resource flags can be:

- `n`
- `h`
- `q`
- `f`
- `nh`
- `fh`

**set resource** `<resource name>` `type = <type>`

Sets the type of the named resource to the specified type. For example:

```
qmgr -c "set resource foo type=string_array"
```

**set resource** `<resource name>` `flag = <flag(s)>`

Sets the flag(s) of the named resource to the specified flag(s). For example:

```
qmgr -c "set resource foo flag=nh"
```

**set resource** `<resource name>` `type=<type>, flag=<flag(s)>`

Sets the type and flag(s) of the named resource to the specified type and flag(s). For example:

```
qmgr -c "set resource foo type=long,flag=nh"
```

You can set multiple resources by separating the names with commas. For example:

```
qmgr -c "set resource r1, r2 type=long"
```
You cannot set the type for a resource that is requested by a job or reservation, or set on a server, queue, or vnode.

You cannot set the flag(s) to \textit{n, h, f, nh, fh}, or \textit{q} for a resource that is requested by a job or reservation.

\subsection{Unsetting Custom Resource Flag(s)}

You can use the \texttt{qmgr} command to unset the flag(s) for custom resources.

\texttt{unset resource <resource name> flag}

Unsets the flag(s) of the named resource. For example:

\texttt{qmgr -c "unset resource foo flag"}

You can unset the flag(s) of multiple resources by separating the resource names with commas. For example:

\texttt{qmgr -c "unset resource r1, r2 flag"}

You cannot unset the type for a resource.

You cannot unset the flag(s) for a resource that is requested by a job or reservation, or set on any server, queue, or vnode.
2.48.6.11 Listing Object Attributes

You can use the `qmgr` command to list attributes of any object.

```
list <object type> <object name>[,<object name> ...]
```

Lists the attributes, with associated values, of the named object(s).

```
list <object type> <object name> <attribute name>[, <attribute name>]...
```

Lists values of the specified attributes of the named object.

```
list <object type>
```

Lists attributes, with associated values, of active objects of the specified type at the active server.

```
list <object type> @<server>
```

Lists all objects of the specified type at the specified server, with their attributes and the values associated with the attributes.

```
list server
```

Lists attributes of the active server. If no server other than the default server has been made active, lists attributes of the default server (it is the active server).

```
list server <server>
```

Lists attributes of the specified server.

```
list hook
```

Lists all hooks, along with their attributes.

```
list hook <hook name>
```

Lists attributes of the specified hook.

2.48.6.12 Listing Resource Definitions

You can use the `qmgr` command to resource definitions.
Chapter 2  

PBS Commands

When used with resources, `qmgr` lists the resource name, type, and flag(s). When used by a non-privileged user, prints only resource definitions for resources that are visible to non-privileged users (do not have the `i` flag set).

\[ list \ <resource> \ <resource \ name>[,\ <resource \ name> \ ...] \]

Lists the name, type, and flag(s) of the named resource(s).

\[ list \ <resource> \]

Lists name, type, and flag(s) of custom resources only.

\[ list \ resource \ @<server> \]

Lists all resources at the specified server, with their names, types, and flags.
2.48.6.13 Printing Creation and Configuration Commands and Resource Definitions

For printing the creation commands for any object except for a built-in hook, and for printing resource definitions.

\[ \text{print} \ <\text{object type}> \ <\text{object name}>, <\text{object name}> ... \]

where \(<\text{object name}>\) follows the name rules in section 2.48.5.3, “Object Names”, on page 163. Prints out the commands required to do the following:

- Create the named object(s)
- Set object attributes to their current values

For resources, prints out the resource definition: name, type, and flag(s)

\[ \text{print} \ <\text{object type}> \ <\text{object name}>, [<\text{attribute name}>, <\text{attribute name}>]... \]

where \(<\text{object name}>\) follows the name rules in section 2.48.5.3, “Object Names”, on page 163.

Prints out the commands required to do the following:

- Create the named object
- Set specified object attributes to their current values

\[ \text{print} \ <\text{object type}> \]

Prints out the commands to create and configure the active objects of the named type.

For resources, prints out definitions for all custom resources. Invisible resources will not appear for a non-privileged user.

\[ \text{print} \ <\text{object type}> @<\text{server}> \]

Prints out the commands to create and configure all of the objects of the specified type at the specified server.

For resources, prints out definitions for all custom resources. Invisible resources will not appear for a non-privileged user.

\[ \text{print} \ \text{server} \]

Prints information for the active server; if there is no active server, prints information for the default server.

For resources, prints out definitions for all custom resources. Invisible resources will not appear for a non-privileged user.

Prints out the commands required to do the following for the server and queues, but not hooks:
Chapter 2 PBS Commands

- Create each queue
- Set the attributes of each queue to their current values
- Set the attributes of the server to their current values

print hook

Prints out the commands to create and configure all hooks.

print hook <hook name>

Prints out the commands to create and configure the specified hook.

2.48.6.14 Printing Usage Information

You use the help command or a question mark ("?") to invoke the qmgr built-in help function. You can request usage information for any of the qmgr commands, and for topics including attributes, operators, names, and values.

help <command or topic>

? <command or topic>

Prints out usage information for the specified command or topic.

For example, to print usage information for the set command:

```
qmgr
Qmgr: help set
Syntax: set object [name][,name...] attribute[,resource] OP value
```

2.48.7 Saving and Re-creating Configuration

To save and recreate a configuration, print the configuration information to a file, then read it back in later.

2.48.7.1 Saving Queue Information

Before re-creating queue and server configuration, use this command to save the configuration/creation commands to a file:

```
qmgr: print server > savedsettings
```

When re-creating the queue and server configuration, read the commands into qmgr:

```
qmgr < savedsettings
```
2.48.7.2 Saving Hook Information

To save creation and configuration information for all hooks:

```
# qmgr -c "print hook" > hook.qmgr
```

To re-create all hooks:

```
# qmgr < hook.qmgr
```

2.48.8 Standard Input

The qmgr command reads standard input for directives until end-of-file is reached, or the exit or quit directive is read.

2.48.9 Standard Output

If standard output is connected to a terminal, a command prompt is written to standard output when qmgr is ready to read a directive.

If the -e option is specified, qmgr will echo the directives read from standard input to standard output.

2.48.10 Standard Error

If the -z option is not specified, the qmgr command writes a diagnostic message to standard error for each error occurrence.

2.48.11 Exit Status

Upon successful processing of all the operands presented to the qmgr command, the exit status is zero.

If the qmgr command fails to process any operand, the command exits with a value greater than zero.

2.48.12 Caveats

2.48.12.1 Setting Vnode Attributes

- Most of a vnode’s attributes may be set using qmgr. However, some must be set on the individual execution host in local vnode definition files, NOT by using qmgr. See
"Choosing Configuration Method" on page 52 in the PBS Professional Administrator’s Guide.

• You cannot set the type attribute for a pbshook.

2.48.12.2 Restrictions on Built-in Hooks

You cannot do the following with built-in hooks:

• Import a pbshook
• Export a pbshook
• Print creation commands for a pbshook
• Create a pbshook
• Delete a pbshook
• Set the type attribute for a pbshook
2.48.13 Examples

The following are examples of qmgr directives:

Example 2-13: List serverA’s scheduler’s attributes

```
list sched @serverA
```

Example 2-14: List attributes for default server’s scheduler

```
l sched @default
```

Example 2-15: List PBS version for default server’s scheduler

```
l sched @default pbs_version
```

Example 2-16: Set software resource on mynode

```
set node mynode resources_available.software = "myapp=/tmp/foo"
```

Example 2-17: Create queue

```
create queue fast priority=10,queue_type=e,enabled = true,max_running=0
```

Example 2-18: Increase limit on queue

```
set queue fast max_running +=2
```

Example 2-19: Create queue, set resources

```
create queue little
set queue little resources_max.mem=8mw,resources_max.cput=10
```

Example 2-20: Unset limit on queue

```
unset queue fast max_running
```

Example 2-21: Set node offline

```
set node state = "offline"
```

Example 2-22: Define active list

```
active server s1,s2,s3
```

Example 2-23: List a queue

```
list queue @server1
```

Example 2-24: Set limit on queue

```
set queue max_running = 10
```

Example 2-25: To create a provisioning hook called Provision_Hook, and import the ASCII hook script called “master_provision.py” located in /root/data/:
Qmgr: create hook Provision_Hook  
Qmgr: import hook Provision_Hook application/x-python default /root/data/master_provision.py

2.49 qmove

Moves PBS batch job

2.49.1 Synopsis

qmove destination job_identifier ...
qmove --version

2.49.2 Description

To move a job is to remove the job from the queue in which it resides and place the job in another queue.

The qmove command can be used on job arrays, but not on subjobs or ranges of subjobs. Note that job arrays can only be moved from one server to another if they are in the ‘Q’, ‘H’, or ‘W’ states, and only if there are no running subjobs. The state of the job array is preserved, and the job array will run to completion on the new server.

A job in the Running, Transiting, or Exiting state cannot be moved.

A job in the process of provisioning cannot be moved.

The behavior of the qmove command may be affected by any site hooks. Site hooks can modify the job’s attributes, change its routing, etc.
2.49.3 **Effect of Privilege on Behavior**

An unprivileged user can use the `qmove` command to move a job only when the move would not violate queue restrictions. A privileged user (root, Manager, Operator) can use the `qmove` command to move a job under some circumstances where an unprivileged user cannot. The restrictions that apply only to unprivileged users are listed here:

- The queue must be enabled
- Moving the job into the queue must not exceed the queue’s limits for jobs or resources
- If the job is an array job, the size of the job array must not exceed the queue’s `max_array_size`
- If the queue is accepting jobs only from routing queues, unprivileged users cannot move jobs into it using the `qmove` command

2.49.4 **Options**

---version

The `qmove` command returns its PBS version information and exits. This option can only be used alone.

2.49.5 **Operands**

The first operand is the new destination for the jobs. It will be accepted in the syntax:

```
queue
@server
queue@server
```

See [Chapter 7, "Formats", on page 421](#) for destination identifier information.

If the destination operand describes only a queue, then `qmove` will move jobs into the queue of the specified name at the job’s current server.

If the destination operand describes only a batch server, then `qmove` will move jobs into the default queue at that batch server.

If the destination operand describes both a queue and a batch server, then `qmove` will move the jobs into the specified queue at the specified server.

All following operands are `job_identifiers` which specify the jobs to be moved to the new destination. The `qmove` command accepts one or more `job_identifier` operands of the form:

```
sequence_number[.server_name][@server]
```
Note that some shells require that you enclose a job array identifier in double quotes.

### 2.49.6 Standard Error

The `qmove` command will write a diagnostic messages to standard error for each error occurrence.

### 2.49.7 Exit Status

- Upon successful processing of all the operands presented to the `qmove` command, the exit status will be a value of zero.
- If the `qmove` command fails to process any operand, the command exits with a value greater than zero.

### 2.49.8 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, `qsub(1B), pbs_movejob(3B)`

### 2.50 qmsg

Sends message to PBS batch jobs

#### 2.50.1 Synopsis

```
qmsg [-E] [-O] message_string job_identifier ...
qmsg --version
```

#### 2.50.2 Description

To send a message to a job is to write a message string into one or more output files of the job. Typically this is done to leave an informative message in the output of the job.

The `qmsg` command writes messages into the files of jobs by sending a Message Job batch request to the batch server that owns the job. The `qmsg` command does not directly write the message into the files of the job.

The `qmsg` command cannot be used on job arrays, subjobs or ranges of subjobs.
2.50.3 Options

- E
  Specifies that the message is written to the standard error of each job.

- O
  Specifies that the message is written to the standard output of each job.

--version
  The qmsg command returns its PBS version information and exits. This option can only be used alone.

If no option is specified, the message will be written to the standard error of the job.

2.50.4 Operands

The first operand, message_string, is the message to be written. If the string contains blanks, the string must be quoted. If the final character of the string is not a newline, a newline character will be added when written to the job’s file.

All following operands are job_identifiers which specify the jobs to receive the message string. The qmsg command accepts one or more job_identifier operands of the form:

sequence_number[.server_name][@server]

2.50.5 Standard Error

The qmsg command will write a diagnostic message to standard error for each error occurrence.

2.50.6 Exit Status

- Upon successful processing of all the operands presented to the qmsg command, the exit status will be a value of zero.

- If the qmsg command fails to process any operand, the command exits with a value greater than zero.

2.50.7 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, qsub(1B), pbs_msgjob(3B)
Chapter 2     PBS Commands

2.51   qorder

Exchanges order of two PBS batch jobs.

2.51.1   Synopsis

qorder job_identifier job_identifier
qorder --version

2.51.2   Description

Allows the exchange of two jobs’ positions in the queue or queues in which the jobs reside. No attribute of the job, e.g. priority, is changed. The impact of interchanging the order within or between queues is dependent on local job scheduling policy; contact your systems administrator.

2.51.3   Restrictions

• A job in the running state cannot be reordered.
• The qorder command can be used on job arrays, but not on subjobs or ranges of sub-jobs.
• The two jobs must be located at the same server.

2.51.4   Effect of Privilege on Behavior

For an unprivileged user to reorder jobs, both jobs must be owned by the user. A privileged user (Manager, Operator) can reorder any jobs.

2.51.5   Options

--version
The qorder command returns its PBS version information and exits. This option can only be used alone.
2.51.6 Operands

Both operands are job_identifiers which specify the jobs to be exchanged. The qorder command accepts two job_identifier operands of the form:

sequence_number[.server_name]@[server]

The server specification for the two jobs must agree as to the current location of the two job ids.

Note that some shells require that you enclose a job array identifier in double quotes.

2.51.7 Standard Error

The qorder command will write diagnostic messages to standard error for each error occurrence.

2.51.8 Exit Status

Upon successful processing of all the operands presented to the qorder command, the exit status will be a value of zero.

If the qorder command fails to process any operand, the command exits with a value greater than zero.

2.52 qrerun

Requeues a PBS batch job

2.52.1 Synopsis

qrerun [-W force] job_identifier [job_identifier ...]
qrerun --version
2.52.2 Description

The qrerun command requeues the specified job(s) if possible.

The qrerun command kills the job and requeues it in the execution queue from which it was run.

The qrerun command can be used on job arrays, subjobs, and ranges of subjobs. If you give a job array identifier as an argument, the job array is returned to its initial state at submission time, or to its altered state if it has been qaltered. All of that job array’s subjobs are requeued, which includes those that are currently running, and those that are completed and deleted. If you give a subjob or range as an argument, those subjobs are requeued.

2.52.3 Restrictions

If a job is marked as not rerunnable then qrerun neither kills nor requeues the job. See the -r option on the qsub and qalter commands, and the Rerunnable job attribute.

It cannot requeue a job or subjob which is not running, which is held, or is suspended.

2.52.4 Required Privilege

PBS Manager or Operator privilege is required to use this command.

2.52.5 Options

-W force
  The job is to be requeued even if the vnode on which the job is executing is unreachable, or if the job’s substate is provisioning.

--version
  The qrerun command returns its PBS version information and exits. This option can only be used alone.

2.52.6 Operands

The qrerun command accepts one or more job_identifier operands of the form:

sequence_number[.server_name][@server]

Note that some shells require that you enclose a job array identifier in double quotes.
2.52.7 Standard Error

The `qrerun` command writes a diagnostic message to standard error for each error occurrence.

2.52.8 Exit Status

- Zero upon successful processing of all operands.
- Greater than zero upon failure to process any operand.

2.52.9 See Also

2.53 `qrls`

Releases hold on PBS batch jobs

2.53.1 Synopsis

`qrls [-h hold_list] job_identifier ...`

`qrls --version`

2.53.2 Description

The `qrls` command removes or releases holds which exist on batch jobs.

A job may have one or more types of holds which make the job ineligible for execution. The types of holds are `USER`, `OTHER`, `SYSTEM`, and `bad password`. The different types of holds may require that the user issuing the `qrls` command have special privilege. Typically, the owner of the job will be able to remove a `USER` hold, but not an `OTHER` or `SYSTEM` hold. An Attempt to release a hold for which the user does not have the correct privilege is an error and no holds will be released for that job.

If no `-h` option is specified, the `USER` hold will be released.

Only root or admin can set a bad password hold via `qhold -h p`. The owner of the job can `qrls -h p` a hold set with `qhold -h p`. 
If the job has no `execution_time` pending, the job will change to the *queued* state. If an `execution_time` is still pending, the job will change to the *waiting* state.

### 2.53.3 Options

**-h hold_list**

Defines the types of hold to be released from the jobs. The `hold_list` option argument is a string consisting of one or more of the letters *u*, *o*, or *s* in any combination, or one or more of the letters *n* or *p*. The hold type associated with each letter is:

<table>
<thead>
<tr>
<th>Hold Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>USER</td>
</tr>
<tr>
<td>o</td>
<td>OTHER</td>
</tr>
<tr>
<td>s</td>
<td>SYSTEM</td>
</tr>
<tr>
<td>n</td>
<td>None</td>
</tr>
<tr>
<td>p</td>
<td>Bad password</td>
</tr>
</tbody>
</table>

**--version**

The `qrls` command returns its PBS version information and exits. This option can only be used alone.

### 2.53.4 Operands

The `qrls` command accepts one or more `job_identifier` operands of the form:

```
sequence_number.[server_name][@server]
```

Note that some shells require that you enclose a job array identifier in double quotes.

### 2.53.5 Standard Error

The `qrls` command will write a diagnostic message to standard error for each error occurrence.
2.53.6 Exit Status

- Upon successful processing of all the operands presented to the `qrls` command, the exit status will be a value of zero.
- If the `qrls` command fails to process any operand, the command exits with a value greater than zero.

2.53.7 See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, `qsub(1B)`, `qalter(1B)`, `qhold(1B)`, `pbs_alterjob(3B)`, `pbs_holdjob(3B)`, and `pbs_rlsjob(3B)`

2.54 qrun

Runs a PBS batch job now

2.54.1 Synopsis

```
qrun [-a] [-H vnode-specification] job_identifier_list
qrun [-a] [-H -] job_identifier_list
qrun --version
```

2.54.2 Description

The `qrun` command is used to force a job to run, regardless of scheduling position or resource requirements.

In order to execute `qrun`, the user must have PBS Operator or Manager privilege, and the job must be in the Queued state and reside in an execution queue.

The `qrun` command can be used on a subjob or a range of subjobs, but not on a job array. When it is used on a range of subjobs, the non-running subjobs in that range are run.

The `qrun` command cannot be used on a job that is in the process of provisioning.

When preemption is enabled, the scheduler preempts other jobs in order to run this job. Running a job via `qrun` gives the job higher preemption priority than any other class of job.

You can run a job on the set of resources already assigned to the job, without having to list the resources, by using the `- (dash) argument to the `-H` parameter.
2.54.3 Caveats for qrun

If you use a -H vnode_specification option to run a job, but specify insufficient vnodes or resources, the job may not run correctly. Avoid using this option unless you are sure.

2.54.4 Options to qrun

-a

The qrun command exits before the job actually starts execution.

(no -H option)

A request is made of the Scheduler to schedule this job. The job is run immediately regardless of scheduling policy as long as the following are true:

• The queue in which the job resides is an execution queue.

• Either the resources required by the job are available, or preemption is enabled and the required resources can be made available by preempting jobs that are running.

The qrun command alone overrides the following:

• Limits on resource usage by users, groups, and projects

• Limits on the number of jobs that can be run at a vnode

• Boundaries between primetime and non-primetime, specified in backfill_prime

• Whether the job is in a primetime queue: you can run a job in a primetime queue even when it’s not primetime, or vice versa. Primetime boundaries are not honored.

• Dedicated time: you can run a job in a dedicated time queue, even if it’s not in a dedicated time queue, and vice versa. However, dedicated time boundaries are still honored.

The qrun command alone does not override the following:

• Server and queue resource usage limits

(with -H option)

With the -H option, all scheduling policies are bypassed and the job is run directly. The job will be run immediately on the named or previously assigned vnodes, regardless of current usage on those vnodes with the exception of vnode state. The job will not be run and the qrun request will be rejected if any named vnode is
down, already allocated exclusively, or would need to be allocated exclusively and another job is already running on the vnode.

If the `qrun -H` command is used on a job that requests an AOE, and that AOE is not instantiated on those vnodes, the vnodes are provisioned with the AOE.

If the job requests an AOE, and that AOE is not available on the specified vnodes, the job is held.

-H <vnode_specification, without resources>

The vnode specification without resources has this format:

\((vchunk)[+(vchunk) ...]\)

where vchunk has the format

\(vnode[+vnode ...]\)

Example:

-H (VnodeA+VnodeB)+(VnodeC)

PBS will apply one requested chunk from the job’s selection directive in round-robin fashion to each vchunk in the list. Each vchunk must be sufficient to run the job’s corresponding chunk, otherwise the job may not execute correctly.

-H <vnode_specification, with resources>

The vnode specification with resources has this format:

\((vchunk)[+(vchunk) ...]\)

where vchunk has the format

\(vnode:vnode_resources[+vnode:vnode_resources ...]\)

and where \(vnode_resources\) has the format

\(resource=value[:resource=value ...]\)

Example:

-H (VnodeA:mem=100kb:ncpus=1)+(VnodeB:mem=100kb:ncpus=2+VnodeC:mem=100kb)

PBS creates a new selection directive from the vnode specification, using it instead of the original specification from the user. Any single resource specification will result in the job’s original selection directive being ignored. Each vchunk must be sufficient to run the job’s corresponding chunk, otherwise the job may not execute correctly.

If the job being run requests `-l place=exclhost`, take extra care to satisfy the exclhost request. Make sure that if any vnodes are from a multi-vnoded host, all vnodes from that host are allocated. Otherwise those vnodes can be allocated to other jobs.
-H -
  Runs the job on the set of resources to which it is already assigned.

--version
  The qrun command returns its PBS version information and exits. This option can only be used alone.

2.54.5 Operands

The qrun command accepts a job_identifier_list containing one or more job_identifiers of the form:

sequence_number[.server_name][@server]

Note that some shells require that you enclose a job array identifier in double quotes.

2.54.6 Standard Error

The qrun command will write a diagnostic message to standard error for each error occurrence.

2.54.7 Exit Status

- Zero, on success.
- Greater than zero, if the qrun command fails to process any operand.

2.54.8 See Also

The PBS Professional Administrator’s Guide, qsub(1B), qmgr(8B), pbs_runjob(3B)

2.55 qselect

Selects PBS batch jobs
2.55.1 Synopsis

qselect --version

2.55.2 Description

The qselect command lists those jobs that meet the specified selection criteria. Jobs are selected from a single server.

Each option acts as a filter restricting which jobs are listed. With no options, the qselect command will list all jobs at the server which the user is authorized to list (query status of).

When selecting jobs according to their requested resources, this command can be used only on resources in the Resource_List job attribute, or on the entire selection directive.

Jobs that are finished or moved are listed only when the -x or -H options are used. Otherwise, job selection is limited to queued and running jobs.

2.55.3 Relations

When an option is specified with a optional op component to the option argument, then op specifies a relation between the value of a certain job attribute and the value component of the option argument. If an op is allowable on an option, then the description of the option letter will indicate the op is allowable. The only acceptable strings for the op component, and the relation the string indicates, are shown in the following table of relations:

Table 2-16: Relations

<table>
<thead>
<tr>
<th>Relation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.eq.</td>
<td>the value represented by the attribute of the job is equal to the value represented by the option argument.</td>
</tr>
<tr>
<td>.ne.</td>
<td>the value represented by the attribute of the job is not equal to the value represented by the option argument.</td>
</tr>
<tr>
<td>.ge.</td>
<td>the value represented by the attribute of the job is greater than or equal to the value represented by the option argument.</td>
</tr>
</tbody>
</table>
Options to qselect

-a [op]date_time  
*Deprecated.* Restricts selection to a specific execution time, or a range of execution times.

The `qselect` command selects only jobs for which the value of the `Execution_Time` attribute is related to the `date_time` argument by the optional op operator.

The `date_time` argument has the format:

```
[[CC]YY]MMDDhhmm[.SS]
```

where the MM is the two digits for the month, DD is the day of the month, hh is the hour, mm is the minute, and the optional SS is the seconds. CC is the century and YY the year.

If op is not specified, jobs will be selected for which the `Execution_Time` and `date_time` values are equal. If op is specified, jobs will be selected according to the definitions given in Relations above.

-A account_string

Restricts selection to jobs whose `Account_Name` attribute matches the specified `account_string`.

-c [op]interval

Restricts selection to jobs whose `Checkpoint` interval attribute matches the specified relationship.

The values of the `Checkpoint` attribute are defined to have the following ordered relationship:

### Table 2-16: Relations

<table>
<thead>
<tr>
<th>Relation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.gt.</td>
<td>the value represented by the attribute of the job is greater than the value represented by the option argument.</td>
</tr>
<tr>
<td>.le.</td>
<td>the value represented by the attribute of the job is less than or equal to the value represented by the option argument.</td>
</tr>
<tr>
<td>.lt.</td>
<td>the value represented by the attribute of the job is less than the value represented by the option argument.</td>
</tr>
</tbody>
</table>
If the optional \texttt{op} is not specified, jobs will be selected whose \texttt{Checkpoint} attribute is equal to the interval argument. If \texttt{op} is specified, jobs will be selected according to the rules in Relations above.

For an interval value of \texttt{“u”}, only \texttt{“.eq.”} and \texttt{“.ne.”} are valid.

\textbf{-h hold\_list}

Restricts the selection of jobs to those with a specific set of hold types. Only those jobs will be selected whose \texttt{Hold\_Types} attribute exactly match the value of the \texttt{hold\_list} argument.

The \texttt{hold\_list} argument is a string consisting of the single letter \texttt{n}, or one or more of the letters \texttt{u, o, p, or s} in any combination. If letters are duplicated, they are treated as if they occurred once. The letters represent the hold types:

\begin{table}[h]
\centering
\begin{tabular}{|c|l|}
\hline
\textbf{Hold Type} & \textbf{Meaning} \\
\hline
\texttt{n} & none \\
\texttt{u} & user \\
\texttt{o} & other \\
\texttt{p} & bad password \\
\texttt{s} & system \\
\hline
\end{tabular}
\end{table}

\textbf{-H}

Restricts selection to finished and moved jobs.

\textbf{-J}

Limits the selection to job arrays only.
Chapter 2  

PBS Commands

-`-l resource_list`
  Restricts selection of jobs to those with specified resource amounts. Users without operator or manager privilege cannot specify custom resources which were created to be invisible to users.
  
The resource_list is in the following format:

  `resource_name op value[,resource_name op val,...]`

  The relation operator `op` must be present.

  For job-wide resources, all operators are useful. However, resource specifications for chunks using the select statement, or placement using the place statement are stored as strings. Therefore the only useful operators for these are `.eq.` and `.ne.`.

  The definitions given in Relations above are used when comparing the values of resources.

-`-N name`
  Restricts selection of jobs to those with a specific name.

-`-p [op]priority`
  Restricts selection of jobs to those with a priority that matches the specified relationship. If `op` is not specified, jobs are selected for which the job Priority attribute is equal to the priority.

  If the `op` is specified, the relationship is defined in Relations above.

-`-P project`
  Restrict selection of jobs to those matching the specified project.

  Format: String.

  Project name can contain any characters except for the following: Slash ("/"), left bracket ("["), right bracket ("]"), double quote (""""), semicolon (";"), colon (";"), vertical bar ("|"), left angle bracket ("<"), right angle bracket (">") plus (+), comma (","), question mark ("?"), and asterisk ("*").
PBS Commands

Chapter 2

-q destination
Restricts selection to those jobs residing at the specified destination.
The destination may be of one of the following three forms:

queue
@server
queue@server

If the -q option is not specified, jobs will be selected from the default server.
If the destination describes only a queue, only jobs in that queue on the default batch
server will be selected.
If the destination describes only a server, then jobs in all queues on that server will
be selected.
If the destination describes both a queue and a server, then only jobs in the named
queue on the named server will be selected.

-r rerun
Restricts selection of jobs to those with the specified Rerunnable attribute. The
option argument must be a single character. The following two characters are sup-
ported by PBS: y and n.
Chapter 2  

**PBS Commands**

**-s states**

Restricts job selection to those in the specified states.

The states argument is a character string which consists of any combination of the characters: `B, E, F, H, M, Q, R, S, T, U, W,` and `X`. (A repeated character will be accepted, but no additional meaning is assigned to it.)

**Table 2-18: Job States**

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Job array has started execution.</td>
</tr>
<tr>
<td>E</td>
<td>The <em>Exiting</em> state.</td>
</tr>
<tr>
<td>F</td>
<td>The <em>Finished</em> state.</td>
</tr>
<tr>
<td>H</td>
<td>The <em>Held</em> state.</td>
</tr>
<tr>
<td>M</td>
<td>The <em>Moved</em> state.</td>
</tr>
<tr>
<td>Q</td>
<td>The <em>Queued</em> state.</td>
</tr>
<tr>
<td>R</td>
<td>The <em>Running</em> state.</td>
</tr>
<tr>
<td>S</td>
<td>The <em>Suspended</em> state.</td>
</tr>
<tr>
<td>T</td>
<td>The <em>Transiting</em> state.</td>
</tr>
<tr>
<td>U</td>
<td>Job suspended due to workstation user activity.</td>
</tr>
<tr>
<td>W</td>
<td>The <em>Waiting</em> state.</td>
</tr>
<tr>
<td>X</td>
<td>The <em>eXited</em> state. Subjobs only.</td>
</tr>
</tbody>
</table>

Jobs will be selected which are in any of the specified states. Since array jobs are never in states `R, S, T,` or `U`, if those states are specified, no array job will be selected. Subjobs of the array in those states may be selected if `-T` is specified.
-t suboption [comparison] specified-time
   Allows jobs to be selected according to their time attributes. The suboption is one of:

**Table 2-19: Suboptions to the -t Option**

<table>
<thead>
<tr>
<th>Suboption</th>
<th>Time Attribute Selected</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Execution_Time</td>
<td>Time the job began execution</td>
</tr>
<tr>
<td>c</td>
<td>ctime</td>
<td>Job creation time, seconds since epoch</td>
</tr>
<tr>
<td>e</td>
<td>etime</td>
<td>Time the job became eligible to run</td>
</tr>
<tr>
<td>g</td>
<td>eligible_time</td>
<td>Amount of eligible time job accrued waiting to run</td>
</tr>
<tr>
<td>m</td>
<td>mtime</td>
<td>Modification time</td>
</tr>
<tr>
<td>q</td>
<td>qtime</td>
<td>Job queued time</td>
</tr>
<tr>
<td>s</td>
<td>stime</td>
<td>Job start time</td>
</tr>
<tr>
<td>t</td>
<td>estimated.start_time</td>
<td>Job’s estimated start time</td>
</tr>
</tbody>
</table>

The comparison is one of the relations listed above in Relations.
The specified-time is in datetime format. See Chapter 7, "Formats", on page 421.
A time period can be bracketed by using the -t option twice. For example, to select jobs using stime between noon and 3 p.m.:

```
qselect -ts.gt.09251200 -ts.lt.09251500
```

-T

Limits selection to job and subjob identifiers.
 PBS Commands

-\textbf{u user\_list}
  Restricts selection to jobs owned by the specified user names.
  This provides a means of limiting the selection to jobs owned by one or more users.
  The syntax of the \texttt{user\_list} is:

  \texttt{user\_name[@host][,user\_name[@host],...]} 

  Host names may be wild carded on the left end, e.g. “*\_nasa.gov”. User\_name without a “@host” is equivalent to “user\_name@*”, that is at any host. Jobs will be selected which are owned by the listed users at the corresponding hosts.

-\textbf{x}
  Allows selection of finished and moved jobs in addition to queued and running jobs.

-\textbf{X}
  Allows selection of completed or deleted subjobs (subjobs in \texttt{X} state).

-\textbf{--version}
  The \texttt{qselect} command returns its PBS version information and exits. This option can only be used alone.

\textbf{2.55.5 Standard Output}

The list of job identifiers of selected jobs is written to standard output. Each job identifier is separated by white space. Each job identifier is of the form:

\texttt{sequence\_number.server\_name@server}

Where \texttt{sequence\_number.server} is the identifier assigned at submission time; see \texttt{qsub}. \texttt{@server} identifies the server which currently owns the job.

\textbf{2.55.6 Standard Error}

The \texttt{qselect} command will write a diagnostic message to standard error for each error occurrence.

\textbf{2.55.7 Exit Status}

Upon successful processing of all options presented to the \texttt{qselect} command, the exit status will be a value of zero.

If the \texttt{qselect} command fails to process any option, the command exits with a value greater than zero.

2.56 qsig

Send signal to PBS batch job

2.56.1 Synopsis

qsig [-s signal] job_identifier ...
qsig --version

2.56.2 Description

The qsig command requests that a signal be sent to the specified executing batch jobs. The signal is sent to the session leader of the job.

If the -s option is not specified, `SIGTERM` is sent.

- The request to signal a batch job is rejected if:
  - The user is not authorized to signal the job.
  - The job is not in the running state.
  - The requested signal is not supported by the system upon which the job is executing.
  - The job is in the process of provisioning.

The `qsig` command sends a Signal Job batch request to the server which owns the job.

The `qsig` command can be used for job arrays, ranges of subjobs, and subjobs. If it is used on a range of subjobs, the subjobs in the range which are running will be signaled.

2.56.3 Options

-s signal
  Declares which signal is sent to the job.

  The signal argument is either a signal name, e.g. SIGKILL, the signal name without the SIG prefix, e.g. KILL, or an unsigned signal number, e.g. 9. The signal name
SIGNULL is allowed; the server will send the signal 0 to the job which will have no effect. Not all signal names will be recognized by qsig signal name; try issuing the signal number instead.

Two special signal names, “suspend” and “resume”, [note, all lower case], are used to suspend and resume jobs. When suspended, a job continues to occupy system resources but is not executing and is not charged for walltime. Manager or operator privilege is required to suspend or resume a job.

If qsig -s resume is used on a job that was suspended using qsig -s suspend, the job will be resumed when there are sufficient resources.

--version
The qsig command returns its PBS version information and exits. This option can only be used alone.

2.56.4 Operands
The qsig command accepts one or more job_identifier operands. For a job, this has the form:

sequence_number[.server_name][@server]

and for a job array, it is:

sequence_number[][.server_name][@server]

Note that some shells require that you enclose a job array identifier in double quotes.

2.56.5 Standard Error
The qsig command will write a diagnostic messages to standard error for each error occurrence.

2.56.6 Exit Status
Upon successful processing of all the operands presented to the qsig command, the exit status will be a value of zero.

If the qsig command fails to process any operand, the command exits with a value greater than zero.
2.56.7  See Also

The PBS Professional User's Guide, the PBS Professional Administrator's Guide, qsub(1B), pbs_sigjob(3B), pbs_resources(7B)

2.57  qstart

Allows PBS jobs to be run from a queue

2.57.1  Synopsis

qstart destination ...
qstart --version

2.57.2  Description

The qstart command directs that a destination queue should process batch jobs. If the destination is an execution queue, the scheduler will begin to schedule jobs that reside in the queue for execution. If the destination is a routing queue, the server will begin to route jobs from that queue.

In order to execute qstart, the user must have PBS Operator or Manager privilege.

2.57.3  Options

   --version
   The qstart command returns its PBS version information and exits. This option can only be used alone.

2.57.4  Operands

The qstart command accepts one or more destination operands. The operands are one of three forms:

   queue
   @server
   queue@server
Chapter 2  PBS Commands

If queue is specified, the request is to start that queue at the default server. If the @server form is given, the request is to start all queues at that server. If a full destination identifier, queue@server, is given, the request is to start the named queue at the named server.

2.57.5  Standard Error

The qstart command will write a diagnostic message to standard error for each error occurrence.

2.57.6  Exit Status

- Upon successful processing of all the operands presented to the qstart command, the exit status will be a value of zero.
- If the qstart command fails to process any operand, the command exits with a value greater than zero.

2.57.7  See Also

The PBS Professional Administrator’s Guide and the following manual pages: pbs_server(8B), qstop(8B), and qmgr(8B)

2.58  qstat

Displays status of PBS batch jobs, queues, or servers

2.58.1  Synopsis

2.58.1.1  Displaying Job Status

Default format:
qstat [-p] [-J] [-t] [-x] [ [job_identifier | destination] ...]

Long format:
qstat -f [-p] [-J] [-t] [-x] [ [job_identifier | destination] ...]

Alternate format:
qstat [-a [-w] [-H | -i | -r] [-G | -M] [-J] [-n [-1][-w]] [-s [-1][-w]] [-t] [-u user_list] [ [job_identifier | destination] ...]
2.58.1.2 Displaying Queue Status

Default format:
qstat -Q [destination ...]

Long format:
qstat -Q -f [destination ...]

Alternate format:
qstat -q [-G | -M] [destination ...]

2.58.1.3 Displaying Server Status

Default format:
qstat -B [server_name ...]

Long format:
qstat -B -f [server_name ...]

2.58.1.4 Displaying Version Information

qstat --version

2.58.2 Description

The qstat command is used to display the status of jobs, queues, and batch servers. The status information is written to standard output.

Status information can be displayed in a default format, an alternate format, or a long format, depending upon the options given. Default and alternate formats display all status information for a job, queue or server on one line, in columns. Long formats display status information one attribute to a line.

Status information for finished and moved jobs can be displayed using the -x and -H options.

When displaying job status information, the qstat command will display status information about all job_identifiers and destinations specified.

If your job has been moved to another server through peer scheduling, give the job ID as an argument to qstat. If you only give the qstat command, your job will not appear to exist. For example, your job 123.ServerA is moved to ServerB. In this case, use

qstat 123
or

```bash
qstat 123.ServerA
```

To list all jobs at ServerB, you can use:

```bash
qstat @ServerB
```

If your default server is ServerB, and your job started at ServerA but was moved to ServerB, to see the job, you must use:

```bash
qstat 123@ServerA
```

Users without manager or operator privilege cannot view resources or attributes that are invisible to unprivileged users.

### 2.58.3 Displaying Job Status

#### 2.58.3.1 Job Status in Default Format

The `qstat` command will display job status in default format when the options given are among `-p`, `-J`, `-t` or `-x`, regardless of operands. Jobs are displayed one to a line, with these column headers:

```
Job id   Name       User      Time Use S Queue
-------- ---------- --------- -------- - ----- 
```

Description of columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job id</td>
<td>The job_identifier assigned by PB</td>
</tr>
<tr>
<td>Name</td>
<td>Job name assigned by submitter.</td>
</tr>
<tr>
<td>User</td>
<td>Username of job owner.</td>
</tr>
</tbody>
</table>
The CPU time or walltime used by the job, depending on which is specified or inherited. Before the application has actually started running, for example during stage-in, this field is "0". At the point where the application starts accumulating cput or walltime, this field changes to "00:00:00". After that, every time the MoM polls for resource usage, the field is updated.

The MoM on the each execution host polls for the usage of all processes belonging to the job on her host. Usage is summed. The polling interval is short when a job first starts running and lengthens to a maximum 2 minutes. See "Configuring MoM Polling Cycle" on page 57 in the PBS Professional Administrator’s Guide.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Use</td>
<td>The job’s state:</td>
</tr>
<tr>
<td>S</td>
<td>The job’s state:</td>
</tr>
<tr>
<td>B</td>
<td>Array job has at least one subjob running.</td>
</tr>
<tr>
<td>E</td>
<td>Job is exiting after having run.</td>
</tr>
<tr>
<td>F</td>
<td>Job is finished.</td>
</tr>
<tr>
<td>H</td>
<td>Job is held.</td>
</tr>
<tr>
<td>M</td>
<td>Job was moved to another server.</td>
</tr>
<tr>
<td>Q</td>
<td>Job is queued.</td>
</tr>
<tr>
<td>R</td>
<td>Job is running.</td>
</tr>
<tr>
<td>S</td>
<td>Job is suspended.</td>
</tr>
<tr>
<td>T</td>
<td>Job is being moved to new location.</td>
</tr>
<tr>
<td>U</td>
<td>Cycle-harvesting job is suspended due to keyboard activity.</td>
</tr>
<tr>
<td>W</td>
<td>Job is waiting for its submitter-assigned start time to be reached.</td>
</tr>
<tr>
<td>X</td>
<td>Subjob has completed execution or has been deleted.</td>
</tr>
<tr>
<td>Queue</td>
<td>The queue in which the job resides.</td>
</tr>
</tbody>
</table>
2.58.3.2  Job Status in Long Format

If the -f (full) option is given, full job status information for each job is displayed in this order:

- The job ID
- Each job attribute, one to a line
- The job’s submission arguments
- The job’s executable, in JSDL format
- The executable’s argument list, in JSDL format

The job attributes are listed as `name = value` pairs. This includes the `exec_host` string and the `exec_vnode` string. The full output can be very large.

The `exec_host` string has the format:

`hosta/J1+hostb/J2*P+...`

where `J1` and `J2` are an index of the job on the named host and `P` is the number of processors allocated from that host to this job. `P` does not appear if it is 1.

The `exec_vnode` string has the format:

`(vnodeA:ncpus=N1:mem=M1)+(vnodeB:ncpus=N2:mem=M2)+...`

where `N1` and `N2` are the number of CPUs allocated to that job on that vnode, and `M1` and `M2` are the amount of memory allocated to that job on that vnode.

2.58.3.3  Job Status in Alternate Format

The `qstat` command will display job status in the alternate format if any of the `-a`, `-i`, `-G`, `-H`, `-M`, `-n`, `-s`, or `-u user_list` options is given. Jobs are displayed one to a line. If jobs are running and the `-n` option is specified, or if jobs are finished or moved and the `-H` and `-n` options are specified, there is a second line for the `exec_host` string.

2.58.3.3.i  Output:

The output contains the following columns:

<table>
<thead>
<tr>
<th>Req’d</th>
<th>Req’d</th>
<th>Elap</th>
<th>Job ID</th>
<th>Username</th>
<th>Queue</th>
<th>Jobname</th>
<th>SessID</th>
<th>NDS</th>
<th>TSK</th>
<th>Memory</th>
<th>Time</th>
<th>S Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>------</td>
<td>----</td>
<td>------</td>
<td>--------</td>
<td>------</td>
<td>--------</td>
<td>------</td>
<td>----</td>
<td>-----</td>
<td>--------</td>
<td>------</td>
<td>--------</td>
</tr>
</tbody>
</table>

If `-n` is specified, the column output is followed by the `exec_host` string.
Description of columns:

**Table 2-21: Description of Alternate Format Job Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job ID</td>
<td>The job_identifier assigned by PBS.</td>
</tr>
<tr>

</tr>
<tr>
<td>Elap Time</td>
<td>If CPU time is requested, this shows CPU time. Otherwise, shows walltime.</td>
</tr>
</tbody>
</table>

### 2.58.4 Displaying Queue Status

#### 2.58.4.1 Queue Status in Default Format

The `qstat` command will display queue status in the default format if the only option is `-Q`, regardless of operands. Queue status is displayed one queue to a line, with these column headers:

```
Queue   Max  Tot  Ena  Str  Que  Run  Hld  Wat  Trn  Ext  Type
-------- ---- ---- ---- ---- ---- ---- ---- ---- ---- ---- ----
```
Chapter 2  PBS Commands

Description of columns:

Table 2-22: Description of Default Queue Status Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue</td>
<td>Queue name.</td>
</tr>
<tr>
<td>Max</td>
<td>Maximum number of jobs allowed to run concurrently in the queue.</td>
</tr>
<tr>
<td>Tot</td>
<td>Total number of jobs in the queue.</td>
</tr>
<tr>
<td>Ena</td>
<td>Whether the queue is enabled or disabled.</td>
</tr>
<tr>
<td>Str</td>
<td>Whether the queue is started or stopped.</td>
</tr>
<tr>

<td>Number of jobs being moved (transiting.)</td>
</tr>
<tr>
<td>Ext</td>
<td>Number of exiting jobs.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of queue: execution or routing.</td>
</tr>
</tbody>
</table>

2.58.4.2 Queue Status in Long Format

If the -f (full) option is given, full queue status information for each queue is displayed starting with the queue name, followed by each attribute, one to a line, as name = value pairs.

2.58.4.2.i Queue Status: Alternate Format

The qstat command will display queue status in the alternate format if any of the -q, -G or -M options is given. Queue status is displayed one queue to a line, with these column headers:

    Queue     Memory CPU Time Walltime Node Run Que Im State
    --------   ------ ----- -------- -------- ---- --- --- -- -----
Description of columns:

Table 2-23: Description of Queue Alternate Status Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue</td>
<td>Queue name.</td>
</tr>
<tr>
<td>Memory</td>
<td>Maximum amount of memory that can be requested by a job in the queue.</td>
</tr>
<tr>
<td>CPU Time</td>
<td>Maximum amount of CPU time that can be requested by a job in the queue.</td>
</tr>
<tr>
<td>Walltime</td>
<td>Maximum amount of wall time that can be requested by a job in the queue.</td>
</tr>
<tr>
<td>Node</td>
<td>Maximum number of nodes that can be requested by a job in the queue.</td>
</tr>
<tr>
<td>Run</td>
<td>Number of running jobs. Lowest row is total number of running jobs in all the queues shown.</td>
</tr>
<tr>
<td>Que</td>
<td>Number of queued jobs. Lowest row is total number of queued jobs in all the queues shown.</td>
</tr>
<tr>
<td>Lm</td>
<td>Maximum number of jobs allowed to run concurrently in the queue.</td>
</tr>
<tr>
<td>State</td>
<td>State of the queue: E (enabled) or D (disabled), and R (running) or S (stopped).</td>
</tr>
</tbody>
</table>

2.58.5 Displaying Server Status

2.58.5.1 Server Status in Default Format:

The `qstat` command will display server status if the only option given is `-B`, regardless of operands.

Column headers for default server status:

```
Server Max Tot Que Run Hld Wat Trn Ext Status
```
Chapter 2  

PBS Commands

Description of columns:

**Table 2-24: Description of Server Status Default Display Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Name of the server.</td>
</tr>
<tr>
<td>Max</td>
<td>Maximum number of jobs allowed concurrently running on the server.</td>
</tr>
<tr>
<td>Tot</td>
<td>Total number of jobs currently managed by the server.</td>
</tr>
<tr>
<td>Que</td>
<td>Number of queued jobs.</td>
</tr>
<tr>
<td>Run</td>
<td>Number of running jobs.</td>
</tr>
<tr>

<td>Number of exiting jobs.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the server.</td>
</tr>
<tr>
<td>Server</td>
<td>Status in Long Format:</td>
</tr>
</tbody>
</table>

**2.58.5.2  Server Status in Long Format**

If the -f (full) option is given, full server status information is displayed starting with the server name, followed by each attribute, one to a line, as name = value pairs. PBS version information is listed.

**2.58.6  Options to qstat**

**2.58.6.1  Default Job Status Options**

- `-J`  
  Limits status information to job arrays.

- `-t`  
  Displays status information for jobs, job arrays, and subjobs. When used with `-J` option, limits status information to subjobs.
-p
The Time Use column is replaced with the percentage completed for the job. For an array job this is the percentage of subjobs completed. For a normal job, it is the larger of percentage used walltime or percentage used CPU time. Default format used.

-x
Displays status information for finished and moved jobs in addition to queued and running jobs.

2.58.6.2 Alternate Job Status Options

The following options will cause the alternate job status format to be used:

-a
All queued and running jobs are displayed. If a destination is given, information for all jobs at that destination is displayed. If a job_identifier is given, information about that job is displayed. Always specify this option before the -n or -s options, otherwise they will not take effect.

-H
Without a job identifier, displays information for all finished or moved jobs. If a job identifier is given, displays information for that job regardless of its state.

-i
If a destination is given, information for queued, held or waiting jobs at that destination is displayed. If a job_identifier is given, information about that job is displayed regardless of its state.

-r
If a destination is given, information for running or suspended jobs at that destination is displayed. If a job_identifier is given, information about that task is displayed regardless of its state.

-T
Displays estimated start time for queued jobs, replacing the Elap Time field with the Est Start field. Jobs with earlier estimated start times are displayed before those with later estimated start times. Running jobs are displayed before other jobs. Running jobs are sorted by their stime attribute (start time).

Queued jobs whose estimated start times are unset (estimated.start_time = unset) are displayed after those with estimated start times, with estimated start time shown
as a double dash ("--"). Queued jobs with estimated start times in the past are treated as if their estimated start times are unset.

Time displayed is local to the `qstat` command. Current week begins on Sunday.

The following table shows the format used without the -w option:

**Table 2-25: Format for Estimated Start Time Field without -w Option**

<table>
<thead>
<tr>
<th>Format</th>
<th>Job's Estimated Start Time</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>HH:MM</td>
<td>Today</td>
<td>15:34</td>
</tr>
<tr>
<td>&lt;2-letter weekday&gt; HH</td>
<td>Within 7 days, but after today</td>
<td>We 15</td>
</tr>
<tr>
<td>&lt;3-letter month name&gt;</td>
<td>This calendar year, but after this week</td>
<td>Feb</td>
</tr>
<tr>
<td>YYYY</td>
<td>Less than or equal to 5 years from today, after this year</td>
<td>2012</td>
</tr>
<tr>
<td>&quot;&gt;5yrs&quot;</td>
<td>More than 5 years from today</td>
<td>&gt;5yrs</td>
</tr>
</tbody>
</table>

The following table shows the format used with the -w option:

**Table 2-26: Format for Estimated Start Time Field with -w Option**

<table>
<thead>
<tr>
<th>Format</th>
<th>Job's Estimated Start Time</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Today HH:MM</td>
<td>Today</td>
<td>Today 13:34</td>
</tr>
<tr>
<td>Day HH:MM</td>
<td>This week, but after today</td>
<td>Wed 15:34</td>
</tr>
<tr>
<td>Day Mon Daynum HH:MM</td>
<td>This year, but after this week</td>
<td>Wed Feb 10 15:34</td>
</tr>
<tr>
<td>Day Mon Daynum Year HH:MM</td>
<td>After this year</td>
<td>Wed Feb 10 2011 15:34</td>
</tr>
</tbody>
</table>

When used with the -f option, prints the full timezone-qualified start time.
If a job’s estimated start time cannot be calculated, the start time is shown as a question mark (“?”).

Estimated start time information can be made unavailable to unprivileged users; in this case, the estimated start time appears to be unset.

-u user_list
If a destination is given, status for jobs at that destination owned by users in user_list is displayed. If a job_identifier is given, status information for that job is displayed regardless of the job’s ownership.

Hostnames may be wildcarded, but not domain names. When no hostname is specified, username is for any host.

Format: username[@host] in comma-separated list.

-n
The exec_host string is listed on the line below the basic information. If the -1 option is given, the exec_host string is listed on the end of the same line. If using the -a option, always specify the -n option after -a otherwise the -n option will not take effect.

-s
Any comment added by the administrator or scheduler is shown on the line below the basic information. If the -1 option is given, the comment string is listed on the end of the same line. If using the -a option, always specify the -s option after -a otherwise the -s option will not take effect.

-w
Allows display of wider fields. User name, Queue and Job name can be up to 15 characters wide. Session ID can be up to 8 characters wide and NDS can be up to 4 characters wide.

-1
Reformats qstat output to a single line. Can only be used in conjunction with the -n and/or -s options.

## 2.58.6.3 Queue Status Options

-Q
Display queue status in default format. Operands must be destinations.

-q
Display queue status in alternate format. Operands must be destinations.
Chapter 2  PBS Commands

2.58.6.4  Server Status Options

- B  Display server status. Operands must be names of servers.

2.58.6.5  Job, Queue, and Server Status Options

- f  Full display. Job, queue or server attributes displayed one to a line.

- G  Show size in gigabytes. Alternate format is used.

- M  Show size in megawords. A word is considered to be 8 bytes. Alternate format is used.

2.58.6.6  Version Information

--version  The qstat command returns its PBS version information and exits. This option can only be used alone.

2.58.7  Operands

2.58.7.1  Job Identifier Operands

job_identifier  Job identifier assigned by PBS at submission. Only used with job status requests. Status information for this job is displayed.

2.58.7.2  Destination Operands

Name of queue, name of queue at a specific server, or specification of server.

<queue name>  Specifies name of queue.

<queue name>@<server>  Specifies name of queue at server.

@<server>  Specifies all queues at a server.
When displaying job status:

- If `<queue name>` is given, status is displayed for all jobs in the named queue at the default server.
- If `<queue name>@<server>` is given, status is displayed for all jobs in queue_name at server.
- If `@<server>` is given, status is displayed for all jobs at all queues at that server.

When displaying queue status:

- If `<queue name>` is given, status is displayed for that queue at the default server.
- If `<queue name>@<server>` is given, status is displayed for the named queue at the named server.
- If `@<server>` is given, status is displayed for all queues at that server.

### 2.58.7.3 Server Name Operands

`server_name`

Name of server. Used with the `-B` option to display status for that server.

### 2.58.8 Standard Error

The `qstat` command writes a diagnostic message to standard error for each error occurrence.

### 2.58.9 Exit Status

- Zero upon successful processing of all the operands.
- Greater than zero if any operands could not be processed.
- Non-zero if `x` option is not provided when querying finished jobs.

Chapter 2

PBS Commands

2.59  qstop

Prevents PBS jobs from running from the specified queue

2.59.1  Synopsis

qstop destination ...
qstop --version

2.59.2  Description

The qstop command directs that a destination queue should stop processing batch jobs. If
the destination is an execution queue, the server will cease scheduling jobs that reside in the
queue for execution. If the destination is a routing queue, the server will cease routing jobs
from that queue.

In order to execute qstop, the user must have PBS Operator or Manager privilege.

2.59.3  Options

--version
The qstop command returns its PBS version information and exits. This option
can only be used alone

2.59.4  Operands

The qstop command accepts one or more destination operands. The operands are one of
three forms:
<queue>
@<server>
<queue>@<server>

If <queue> is specified, the request is to stop that queue at the default server. If the
@<server> form is given, the request is to stop all the queues at that server. If a full destina-
tion identifier, <queue>@<server>, is given, the request is to stop the named queue at the
named server.
2.59.5 Standard Error

The `qstop` command will write a diagnostic message to standard error for each error occurrence.

2.59.6 Exit Status

Upon successful processing of all the operands presented to the `qstop` command, the exit status will be a value of zero.

If the `qstop` command fails to process any operand, the command exits with a value greater than zero.

2.59.7 See Also

The PBS Professional Administrator’s Guide and the following manual pages:
`pbs_server(8B)`, `qstart(8B)`, and `qmgr(8B)`

2.60 `qsub`

Submits PBS job

2.60.1 Synopsis

```
```

`qsub --version`

2.60.2 Description

The `qsub` command is used to submit a batch job to PBS. Submitting a PBS job specifies a task, requests resources and sets job attributes.
The `qsub` command can read from a job script, from standard input, or from the command line. When the user has submitted the job, PBS returns the job identifier for that job. For a job, this is of the form:

```
sequence_numberservername
```

For an array job, this is of the form:

```
sequence_number[[]].servername
```

During execution, jobs can be interactive or non-interactive.

By default, on the first invocation, `qsub` spawns a background process to manage communication with the PBS server. Later invocations of `qsub` attempt to communicate with this background process. Under certain circumstances, calls to `qsub` when it uses the background process can result in communication problems. You can prevent `qsub` from spawning a background process by using the `-f` option, although this can degrade performance.

### 2.60.2.1 Where PBS Puts Job Files

By default, PBS copies the `stdout` and `stderr` files from the job back to the current working directory where the `qsub` command is executed. See the `-o` and `-e` options.

### 2.60.2.2 Submitting Jobs By Using Scripts

To submit a PBS job script, the user types

```
qsub [options] scriptname
```
Scripts can be written in Python, UNIX shells such as csh and sh, the Windows command batch language, Perl, etc. The same Python script can be run under UNIX/Linux or under Windows. A PBS job script consists of the following:

- Optional shell specification
- Any PBS directives
- The user’s tasks: programs, commands or applications

Example 2-26: A Python job script named “myjob.py” for a job named “HelloJob” that prints “Hello” under UNIX/Linux or Windows:

```bash
#PBS -l select=1:ncpus=3:mem=1gb
#PBS -N HelloJob
print "Hello"
```

To run a Python job script under UNIX/Linux:

```
qsub -S $PBS_EXEC/bin/pbs_python <script name>
```

To run a Python job script under Windows:

```
qsub -S %PBS_EXEC%/bin/pbs_python.exe <script name>
```

Example 2-27: A script named “weatherscript” for a job named “Weather1” which runs the executable “weathersim” on UNIX/Linux:

```bash
#!/bin/sh
#PBS -N Weather1
#PBS -l walltime=1:00:00
/usr/local/weathersim
```

To submit the job, the user types:

```
qsub weatherscript <return>
```

Example 2-28: A script named “weather.exe” for a job named “Weather1” which runs under Windows:

```
#PBS -N Weather1
#PBS -l walltime=1:00:00
weathersim.exe
```

To submit the job, the user types:

```
qsub weather.exe <return>
```

Scripts can contain comments. Under Windows, comments can contain only ASCII characters. See the PBS Professional User’s Guide.
2.60.2.3 Submitting Jobs From Standard Input

To submit a PBS job by typing job specifications at the command line, the user types

```
qsub [options] <return>
```

then types any directives, then any tasks, followed by

- UNIX: CTRL-D on a line by itself
- Windows: CTRL-Z <return>

to terminate the input.

2.60.2.4 Submitting a Job From the qsub Command Line

To submit a job from the command line, the user types

```
qsub [options] -- executable [arguments to executable] <return>
```

Example 2-29: To run `myprog` with the arguments a and b:

```
qsub -- myprog a b <return>
```

Example 2-30: To run `myprog` with the arguments a and b, naming the job JobA:

```
qsub -N JobA -- myprog a b <return>
```

2.60.2.5 Requesting Resources and Placing Jobs

Requesting resources includes setting limits on resource usage and controlling how the job is placed on nodes.

Resources are requested by using the `-l` option, either in chunks inside of selection statements, or in job-wide requests using `resource_name=value` pairs. See the `pbs_resources(7B)` man page. The selection statement is of the form:

```
-l select=[N:]chunk+[N:]chunk ...
```

where `N` specifies how many of that chunk, and a chunk is of the form:

```
resource_name=value[.resource_name=value ...]
```

Job-wide `resource_name=value` requests are of the form:

```
-l resource_name=value[.resource_name=value ...]
```

The place statement can contain the following elements, in any order:

```
-l place=[ arrangement ][: sharing ][: grouping]
```
where

arrangement
  one of free | pack | scatter | vscatter

sharing
  one of excl | shared | exclhost

grouping
  can have only one instance of group=resource
  and where

free
  Place job on any vnode(s).

pack
  All chunks will be taken from one host.

scatter
  Only one chunk with any MPI processes will be taken from a host. A chunk with no
  MPI processes may be taken from the same node as another chunk.

vscatter
  Only one chunk is taken from any vnode. Each chunk must fit on a vnode.

excl
  Only this job uses the vnodes chosen.

shared
  This job can share the vnodes chosen.

exclhost
  The entire host is allocated to the job.

group=resource
  Chunks will be grouped according to a resource. All nodes in the group must have
  a common value for the resource, which can be either the built-in resource host or a
  site-defined node-level resource.
  Resource must be a string or a string array.
  Note that nodes can have sharing attributes that override job placement requests. See
  the pbs_node_attributes(7B) man page.
  For more on resource requests, usage limits and job placement, see
  pbs_resources(7B).
Chapter 2  

PBS Commands

The place statement cannot begin with a colon.

2.60.2.6 Caveats

Do not mix old style resource or node specifications with the new select and place statements. Do not use one in a job script and the other on the command line. Mixing the two will result in an error.

You cannot submit a job requesting a custom resource which has been created to be invisible or read-only for users, regardless of your privilege. A manager or operator can use the qalter command to change a job’s request for this kind of custom resource.

2.60.2.7 Setting Attributes

The user sets job attributes by giving options to the qsub command or by using PBS directives. Each qsub option except -C, -q, and -z sets a job attribute, and has a corresponding PBS directive with the same syntax as the option. Attributes set via command-line options take precedence over those set using PBS directives. See the PBS Professional User’s Guide, or section 6.1, “Job Attributes”, on page 393.

2.60.2.8 Changing qsub Behavior

The behavior of the qsub command may be affected by the server’s default_qsub_arguments attribute. This attribute can set the default for any job attribute. The default_qsub_arguments server attribute is settable by the administrator, and is overridden by command-line arguments and script directives. See section 6.6, “Server Attributes”, on page 332.

The behavior of the qsub command may also be affected by any site hooks. Site hooks can modify the job’s attributes, change its routing, etc.

2.60.3 Options to qsub

-a date_time
Point in time after which the job is eligible for execution. Given in pairs of digits. Sets job’s Execution_Time attribute to date_time.

Format: datetime:
PBS Commands

Chapter 2

[[[[CC]YY]MM]DD][hhmm][.SS]
where CC is the century, YY is the year, MM is the month, DD is the day of the month, hh is the hour, mm is the minute, and SS is the seconds.

Each portion of the date defaults to the current date, as long as the next-smaller portion is in the future. For example, if today is the 3rd of the month and the specified day DD is the 5th, the month MM is set to the current month.

If a specified portion has already passed, the next-larger portion is set to one after the current date. For example, if the day DD is not specified, but the hour hh is specified to be 10:00 a.m. and the current time is 11:00 a.m., the day DD is set to tomorrow.

-A account_string
Accounting string associated with the job. Used for labeling accounting data. Sets job's Account_Name attribute to account_string.
Format: string.

-c checkpoint_spec
Determines when the job will be checkpointed. Sets job's Checkpoint attribute. An $action script is required to checkpoint the job.
See the pbs_mom(8B) man page.
The argument checkpoint_spec can take on one of the following values:

c
  Checkpoint at intervals, measured in CPU time, set on job's execution queue. If no interval set at queue, job is not checkpointed

c=<minutes of CPU time>
  Checkpoint at intervals of specified number of minutes of job CPU time. This value must be > 0. If interval specified is less than that set on job's execution queue, queue's interval is used.
  Format: Integer

w
  Checkpoint at intervals, measured in walltime, set on job's execution queue. If no interval set at queue, job is not checkpointed.

w=<minutes of walltime>
  Checkpoint at intervals of the specified number of minutes of job walltime. This value must be greater than zero. If the interval specified is less that that set on the execution queue in which the job resides, the queue's interval is used.
  Format: Integer

n
  No checkpointing.
Chapter 2  

PBS Commands

s
  Checkpoint only when the server is shut down.

u
  Unset. Defaults to behavior when interval argument is set to s.
  Default: u.
  Format: String.

-C directive_prefix
  Defines the prefix identifying a PBS directive. Default prefix is “#PBS”.
  If the directive_prefix argument is a null string, qsub does not scan the script file for directives. Overrides the PBS_DPREFIX environment variable and the default.
  Cannot be used as a PBS directive.

-e path
  Path to be used for the job’s standard error stream. Sets job’s Error_Path attribute to path. The path argument is of the form:
  [hostname:]path_name
  The path is interpreted as follows:
  path_name
    If path_name is a relative path, then it is taken to be relative to the current working directory of the qsub command, where it is executing on the current host.
    If path_name is an absolute path, then it is taken to be an absolute path on the current host where the qsub command is executing.
  hostname:path_name
    If path_name is a relative path, then it is taken to be relative to the user’s home directory on the host named hostname.
    If path_name is an absolute path, then it is the absolute path on the host named hostname.
    If path_name does not include a filename, the default filename is
      jobid.ER
  If the -e option is not specified, PBS copies the standard error to the current working directory where the qsub command was executed. The default filename for the standard error stream is used. It has this form:
  job_name.e<sequence number>
  If you use a UNC path for output or error files, the hostname is optional. If you use a non-UNC path, the hostname is required.
  This option is overridden by the -k option.
PBS Commands

Chapter 2

-f
Prevents qsub from spawning a background process. By default, qsub spawns a background process to manage communication with the PBS server. When this option is specified, the qsub process connects directly to the server and no background process is created.

NOTE: Use of this option will degrade performance of the qsub command when calls are made in rapid succession.

-h
Applies a user hold to the job. Sets the job’s Hold_Types attribute to “u”.

-l
Job is to be run interactively. Sets job’s interactive attribute to True. The job is queued and scheduled as any PBS batch job, but when executed, the standard input, output, and error streams of the job are connected to the terminal session in which qsub is running. If a job script is given, only its directives are processed. When the job begins execution, all input to the job is taken from the terminal session. See the PBS Professional User’s Guide for additional information on interactive jobs.

Interactive jobs are not rerunnable.

Job arrays cannot be interactive.

When used with -Wblock=true, no exit status is returned.

-j join
Whether and how to join the job’s standard error and standard output streams. Sets job’s Join_Path attribute to join.

Possible values of join:

<table>
<thead>
<tr>
<th>Suboption</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>oe</td>
<td>Standard error and standard output are merged into standard output.</td>
</tr>
<tr>
<td>eo</td>
<td>Standard error and standard output are merged into standard error.</td>
</tr>
<tr>
<td>n</td>
<td>Standard error and standard output are not merged.</td>
</tr>
</tbody>
</table>

Default: not merged.
-J range
Declares that this job is an array job. Sets job’s array attribute to True. The argument range identifies the integers greater than or equal to zero that are associated with the subjobs of the array. range is specified in the form X-Y[:Z] where X is the first index, Y is the upper bound on the indices and Z is the stepping factor. For example, 2-7:2 will produce indices of 2, 4, and 6. If Z is not specified, it is taken to be 1.

-k keep
Specifies whether and which of the standard output and standard error streams is retained on the execution host. Overrides default path names for these streams. Sets the job’s Keep_Files attribute to keep.
Default: neither is retained.
In the case where output and/or error is retained on the execution host in a job-specific staging and execution directory created by PBS, these files are deleted when PBS deletes the directory.
The keep argument can take on the following values:

<table>
<thead>
<tr>
<th>Suboption</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>e</td>
<td>The standard error stream is retained on the execution host, in the job’s staging and execution directory. The filename is job_name.e&lt;sequence number&gt;</td>
</tr>
<tr>
<td>o</td>
<td>The standard output stream is retained on the execution host, in the job’s staging and execution directory. The filename is job_name.o&lt;sequence number&gt;</td>
</tr>
<tr>
<td>eo, oe</td>
<td>Both standard output and standard error streams are retained on the execution host, in the job’s staging and execution directory.</td>
</tr>
<tr>
<td>n</td>
<td>Neither stream is retained.</td>
</tr>
</tbody>
</table>

-I resource_list
Allows the user to request resources and specify job placement. Sets job’s Resource_list attribute to resource_list. Requesting a resource places a limit on its usage.
Requesting resources in chunks:
PBS Commands

-`l select=[N:]chunk+[N:]chunk ...`
  where N specifies how many of that chunk, and a chunk is:

  `resource_name=value[:resource_name=value ...]`

  Requesting job-wide resources:

  -`l resource_name=value[:resource_name=value ...]`

  Specifying placement of jobs:

  -`l place=modifier[:modifier]`

  where modifier is any combination of `group`, `excl`, and/or one of `free|pack|scatter`.

  For more on resource requests, usage limits and job placement, see `pbs_resources(7B)`.

-`m mail_events`

  The set of conditions under which mail about the job is sent. Sets job’s `Mail_Points` attribute to `mail_events`. The `mail_events` argument can be either “n” or any combination of `a`, `b`, and `e`.

  **Table 2-29: Suboptions to m Option**

<table>
<thead>
<tr>
<th>Suboption</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>n</code></td>
<td>No mail will be sent.</td>
</tr>
<tr>
<td><code>a</code></td>
<td>Mail is sent when the job is aborted by the batch system.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Mail is sent when the job begins execution.</td>
</tr>
<tr>
<td><code>e</code></td>
<td>Mail is sent when the job terminates.</td>
</tr>
</tbody>
</table>

  Format: string.

  Default value: “a”.

-`M user_list`

  List of users to whom mail about the job is sent. Sets job’s `Mail_Users` attribute to `user_list`.

  The user_list argument is of the form:

  `user[@host][,user[@host],...]`

  Default: job owner.
Chapter 2

PBS Commands

-N name
Sets job’s Job_Name attribute and name to name.
Format: string, up to 236 characters in length. It must consist of an alphabetic or numeric character followed by printable, nonwhite-space characters.
Default: if a script is used to submit the job, the job’s name is the name of the script. If no script is used, the job’s name is “STDIN”.

-o path
Path to be used for the job’s standard output stream. Sets job’s Output_Path attribute to path. The path argument is of the form:

[hostname:]path_name
The path is interpreted as follows:

path_name
If path_name is a relative path, then it is taken to be relative to the current working directory of the command, where it is executing on the current host.
If path_name is an absolute path, then it is taken to be an absolute path on the current host where the command is executing.

hostname:path_name
If path_name is a relative path, then it is taken to be relative to the user’s home directory on the host named hostname.
If path_name is an absolute path, then it is the absolute path on the host named hostname.
If path_name does not include a filename, the default filename is jobid.OU
If the -o option is not specified, PBS copies the standard output to the current working directory where the qsub command was executed. The default filename for the standard output stream is used. It has this form:

job_name.o<sequence number>
If you use a UNC path, the hostname is optional. If you use a non-UNC path, the hostname is required.
This option is overridden by the -k option.

-p priority
Priority of the job. Sets job’s Priority attribute to priority.
Format: host-dependent integer.
Range: [-1024, +1023] inclusive.
Default: zero.
-P project
  Specifies a project for the job. Sets job's project attribute to specified value.
  Format: String.
  Project name can contain any characters except for the following: Slash ("/"), left
  bracket ("[") right bracket ("]"), double quote (""""), semicolon (";"), colon (":"), ver-
  tical bar ("|"), left angle bracket ("<"), right angle bracket (">") plus ("+"), comma
  (",") question mark ("?"), and asterisk ("*").
  Default value: ".pbs_project_default".

-q destination
  Where the job is sent upon submission.
  Specifies a queue, a server, or a queue at a server. The destination argument can
  have one of these formats:
  
  <queue>
    Job is submitted to the named queue at the default server.
  
  @<server>
    Job is submitted to the default queue at the named server.
  
  <queue>@<server>
    Job is submitted to the named queue at the named server.
  
  Default: default queue at default server.

-r y|n
  Declares whether the job is rerunnable. See the qrerun(1B) command.
  Sets job’s Rerunnable attribute to the argument.
  Format: single character, “y” or “n”.

<table>
<thead>
<tr>
<th>Suboption</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>Job is rerunnable.</td>
</tr>
<tr>
<td>n</td>
<td>Job is not rerunnable.</td>
</tr>
</tbody>
</table>

Default: “y”.
Interactive jobs are not rerunnable.

Table 2-30: Suboptions to r Option
Chapter 2  PBS Commands

-S path_list
Specifies the interpreter or shell path for the job script. Sets job’s Shell_Path_List attribute to path_list.

The path_list argument is the full path to the interpreter or shell including the executable name.

Only one path may be specified without a host name. Only one path may be specified per named host. The path selected is the one whose host name is that of the server on which the job resides.

Format: path[@host][,path@host ...]
Default: user’s login shell on execution node.

Example of using bash via a directive:

    #PBS -S /bin/bash@mars,/usr/bin/bash@jupiter

Example of running a Python script from the command line on UNIX/Linux:

    qsub -S $PBS_EXEC/bin/pbs_python <script name>

Example of running a Python script from the command line on Windows:

    qsub -S %PBS_EXEC%/bin/pbs_python.exe <script name>

-u user_list
List of usernames. Job is run under a username from this list. Sets job’s User_List attribute to user_list.

Only one username may be specified without a host name. Only one username may be specified per named host. The server on which the job resides will select first the username whose host name is the same as the server name. Failing that, the next selection will be the username with no specified hostname. The usernames on the server and execution hosts must be the same. The job owner must have authorization to run as the specified user.

Format of user_list:

    user[@host][,user@host ...]
Default: job owner (username on submit host.)

-v variable_list
Specifies environment variables and shell functions to be exported to the job. This is the list of environment variables which is added to those already automatically exported. These variables exist in the user’s login environment from which qsub is run. The job’s Variable_List attribute is appended with the variables in variable_list and their values. See section 2.60.7, “Environment Variables”, on page 244.

Format: comma-separated list of strings in the form:
variable
or
variable=value
If a variable=value pair contains any commas, the value must be enclosed in single
or double quotes, and the variable=value pair must be enclosed in the kind of quotes
not used to enclose the value. For example:

```
qsub -v "var1='A,B,C,D'" job.sh
qsub -v a=10, "var2='A,B'", c=20, HOME=/home/zzz job.sh
```
Default: no environment variables are added to job’s variable list.

-\nDeclares that all environment variables and shell functions in the user’s login envi-
ronment where qsub is run are to be exported to the job. The job’s Variable_List
attribute is appended with all of these environment variables and their values.

-W additional_attributes
The -W option allows specification of any job attribute. Some job attributes must be
specified using this option. Those attributes are listed below. Format:

```
-W attribute_name=value[,attribute_name=value...]
```
If white space occurs within the additional_attributes argument, or the equal sign “=”
occurs within an attribute_value string, then that must be enclosed with single- or
doublequotes.
The following attributes must be set using the -W option:

depend=dependency_list
Defines dependencies between this and other jobs. Sets the job’s depend
attribute to dependency_list. The dependency_list has the form:

```
type:arg_list[,type:arg_list...]
```
where except for the on type, the arg_list is one or more PBS job IDs in the
form:

```
jobid[jobid ...]
```
The type can be:

```
after: arg_list
```
This job may be scheduled for execution at any point after all jobs in
arg_list have started execution.

```
afterok: arg_list
```
This job may be scheduled for execution only after all jobs in arg_list have
terminated with no errors. See “Warning about exit status with csh” in Exit
Status.
Chapter 2  PBS Commands

afternotok: arg_list
This job may be scheduled for execution only after all jobs in arg_list have terminated with errors. See section 2.60.8.1, “Warning About Exit Status with csh”, on page 245.

afterany: arg_list
This job may be scheduled for execution after all jobs in arg_list have finished execution, with any exit status (with or without errors.) This job will not run if a job in the arg_list was killed.

before: arg_list
Jobs in arg_list may begin execution once this job has begun execution.

beforeok: arg_list
Jobs in arg_list may begin execution once this job terminates without errors. See “Warning about exit status with csh” in Exit Status.

beforenok: arg_list
If this job terminates execution with errors, then jobs in arg_list may begin. See section 2.60.8.1, “Warning About Exit Status with csh”, on page 245.

beforeany: arg_list
Jobs in arg_list may begin execution once this job terminates execution, with or without errors.

on: count
This job may be scheduled for execution after count dependencies on other jobs have been satisfied. This type is used in conjunction with one of the before types listed. count is an integer greater than 0.

Job IDs in the arg_list of before types must have been submitted with a type of on.
To use the before types, the user must have the authority to alter the jobs in arg_list. Otherwise, the dependency is rejected and the new job aborted.
Error processing of the existence, state, or condition of the job on which the newly submitted job is a deferred service, i.e. the check is performed after the job is queued. If an error is detected, the new job will be deleted by the server. Mail will be sent to the job submitter stating the error.
Dependency examples:

    qsub -W depend=afterok:123.host1.domain.com /tmp/script
    qsub -W depend=before:234.host1.com:235.host1.com /tmp/script
group_list=g_list
List of group names. Job is run under a group name from this list. Sets job’s

group_List attribute to g_list.

Only one group name may be specified without a host name. Only one group
name may be specified per named host. The server on which the job resides will
select first the group name whose host name is the same as the server name.
Failing that, the next selection will be the group name with no specified host-
name. The group names on the server and execution hosts must be the same.
The job submitter’s primary group is automatically added to the list.

Under Windows, the primary group is the first group found for the user by PBS
when it queries the accounts database.

Format of g_list:

group[@host][,group@host ...]
Default: login group name of job owner.

pwd
pwd=
pwd=

These forms prompt the user for a password. A space between W and pwd is
optional. Spaces between the quotes are optional. Examples:

    qsub ... -W pwd <return>
    qsub ... -W pwd='' <return>
    qsub ... -W pwd=" " <return>

Available on Windows and supported Linux x86 and x86_64 platforms only.

block=true
Specifies that qsub waits for the job to terminate, then returns the job’s exit
value. Sets job’s block attribute to TRUE. When used with X11 forwarding or
interactive jobs, no exit value is returned. See section 2.60.8, “Exit Status”, on
page 245.

run_count=<value>
Sets the number of times the server thinks it has run the job. Sets the value of
the job’s run_count attribute. Format: integer greater than or equal to zero.

sandbox=<value>
Determines which directory PBS uses for the job’s staging and execution. If
value is PRIVATE, PBS creates a job-specific directory for staging and execution. If value is HOME or is unset, PBS uses the user’s home directory for stag-
ing and execution.
stagein=path_list
stageout=path_list
Specifies files or directories to be staged-in before execution or staged-out after execution is complete. Sets the job’s stagein and stageout attributes to the specified path_lists. On completion of the job, all staged-in and staged-out files and directories are removed from the execution host(s). The path_list has the form:
filespec[,filespec]
where filespec is
local_path@hostname:remotepath
regardless of the direction of the copy. The name local_path is the name of the file or directory on the primary execution host. It can be relative to the staging and execution directory on the execution host, or it can be an absolute path.
The “@” character separates local_path from remotepath.
The name remotepath is the path on hostname. The name can be relative to the staging and execution directory on the primary execution host, or it can be an absolute path.
If path_list has more than one filespec, i.e. it contains commas, it must be enclosed in double-quotes.
If you use a UNC path, the hostname is optional. If you use a non-UNC path, the hostname is required.

umask=NNNN
The umask with which the job is started. Sets job’s umask attribute to NNNN. Controls umask of job’s standard output and standard error.
The following example allows group and world read on the job’s output:
-W umask=33
Can be used with one to four digits; typically two.
Default value: 077
PBS Commands

-\(X\)
  Allows user to receive X output from interactive job.
  \(DISPLA\)Y variable in submission environment must be set to desired display.
  Can be used with interactive jobs only: must be used with -I or -W \texttt{interactive=true}.
  Cannot be used with \(-v \ DISPLA\)Y.
  When used with \(-W\) \texttt{block=true}, no exit status is returned.
  Can be used with -V option.
  Not available under Windows.

-\(Z\)
  Job identifier is not written to standard output.

--\texttt{version}
  The \texttt{qsub} command returns its PBS version information and exits. This option can only be used alone.

2.60.4 Operands

The \texttt{qsub} command accepts as operands one of the following:

\texttt{(script)}
  Path to script. Can be absolute or relative to current directory where \texttt{qsub} is run.

\texttt{-(a dash)}
  Any PBS directives and user tasks are read from the command line. Same as for no operands.

\texttt{-- executable [arguments to executable]}
  a single executable (preceded by two dashes) and its arguments
  The executable, and any arguments to the executable, are given on the \texttt{qsub} command line. The executable is preceded by two dashes, \\
  \texttt{--}.
  If a script or executable is specified, it must be the last argument to \texttt{qsub}. The arguments to an executable must follow the name of the executable.

2.60.5 Standard Output

Unless the -\(Z\) option is set, the job identifier assigned to the job is written to standard output if the job is successfully created.
2.60.6 Standard Error

The `qsub` command writes a diagnostic message to standard error for each error occurrence.

2.60.7 Environment Variables

The `qsub` command uses the following environment variables:

- **PBS_DEFAULT**
  Name of default server.

- **PBS_DPREFIX**
  Prefix string which identifies PBS directives.

Environment variables beginning with “`PBS_O_`” are created by `qsub`. PBS automatically exports the following environment variables to the job, and the job’s `Variable_List` attribute is set to this list:

- **PBS_ENVIRONMENT**
  Set to `PBS_BATCH` for a batch job. Set to `PBS_INTERACTIVE` for an interactive job. Created upon execution.

- **PBS_JOBDIR**
  Pathname of job’s staging and execution directory on the primary execution host.

- **PBS_JOBID**
  Job identifier given by PBS when the job is submitted. Created upon execution.

- **PBS_JOBNAME**
  Job name given by user. Created upon execution.

- **PBS_NODEFILE**
  Name of file containing the list of nodes assigned to the job. Created upon execution.

- **PBS_O_HOME**
  User’s home directory. Value of `HOME` taken from user’s submission environment.

- **PBS_O_HOST**
  Name of submit host. Value taken from user’s submission environment.

- **PBS_O_LANG**
  Value of `LANG` taken from user’s submission environment.

- **PBS_O_LOGNAME**
  User’s login name. Value of `LOGNAME` taken from user’s submission environment.

- **PBS_O_MAIL**
  Value of `MAIL` taken from user’s submission environment.
PBS Commands

### PBS_O_PATH
User’s PATH. Value of PATH taken from user’s submission environment.

### PBS_O_QUEUE
Name of the queue to which the job was submitted. Value taken from user’s submission environment.

### PBS_O_SHELL
Value taken from user’s submission environment.

### PBS_O_SYSTEM
Operating system, from `uname -s`, on submit host. Value taken from user’s submission environment.

### PBS_O_TZ
Value taken from user’s submission environment.

### PBS_O_WORKDIR
Absolute path to directory where `qsub` is run. Value taken from user’s submission environment.

### PBS_QUEUE
Name of the queue from which the job is executed. Created upon execution.

### PBS_TMPDIR
Pathname of job’s scratch directory.

#### 2.60.8 Exit Status

- Zero upon successful processing of input. Exit value is greater than zero upon failure of `qsub`.
- For blocking jobs, `qsub` exits and returns the exit value of the job. If the job is deleted without being run, `qsub` returns an exit value of 3.

##### 2.60.8.1 Warning About Exit Status with `csh`

If a job is run in `csh` and a `.logout` file exists in the home directory in which the job executes, the exit status of the job is that of the `.logout` script, not the job script. This may impact any inter-job dependencies.

2.61 qterm

Terminates a PBS server

2.61.1 Synopsis

qterm [ -f | -F | -i ] [ -m ] [ -s ] [ -t type ] [ server[ server ...] ]
qterm --version

2.61.2 Description

The qterm command terminates a PBS batch server.

Once the server is terminating, no new jobs are accepted by the server, and no jobs are allowed to begin execution. The impact on running jobs depends on the way the server is shut down.

The qterm command does not exit until the server has completed its shutdown procedure.

If the complex is configured for failover, and the primary server is shut down, the normal behavior for the secondary server is to become active. The qterm command provides options to manage the behavior of the secondary server; it can be shut down, forced to remain idle, or shut down in place of the primary server.

In order to run the qterm command, the user must have PBS Operator or Manager privilege.
2.61.3 Options

The following table lists the options to the `qterm` command.

Table 2-31: Options to qterm

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(no option)</td>
<td>The <code>qterm</code> command defaults to <code>-t quick</code>.</td>
</tr>
<tr>
<td>-f</td>
<td>If the complex is configured for failover, both the primary and secondary servers are shut down. Without the <code>-f</code> option, the primary server is shut down and the secondary server becomes active. The <code>-f</code> option cannot be used with the <code>-i</code> or <code>-F</code> options.</td>
</tr>
<tr>
<td>-F</td>
<td>If the complex is configured for failover, only the secondary server is shut down, and the primary server remains active. The <code>-F</code> option cannot be used with the <code>-f</code> or <code>-i</code> options.</td>
</tr>
<tr>
<td>-i</td>
<td>If the complex is configured for failover, the secondary server remains idle when the primary server is shut down. The <code>-i</code> option cannot be used with the <code>-f</code> or <code>-F</code> options.</td>
</tr>
<tr>
<td>-m</td>
<td>All MoMs (<code>pbs_mom</code>) are shut down. This option does not cause jobs or subjobs to be killed. Jobs are left running subject to other options to the <code>qterm</code> command.</td>
</tr>
<tr>
<td>-s</td>
<td>The scheduler (<code>pbs_sched</code>) is shut down.</td>
</tr>
</tbody>
</table>
### PBS Commands

#### Chapter 2

## Table 2-31: Options to qterm

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| -t <type> | **immediate**
|
|           | All running jobs immediately stop execution. Any running jobs that can be checkpointed are checkpointed, terminated, and requeued. Jobs that cannot be checkpointed are terminated and requeued if they are rerunnable, otherwise they are killed. |
|           | If any job cannot be terminated, for example the server cannot contact the MoM of a running job, the server continues to execute and the job is listed as running. The server can be terminated by a second qterm -t immediate command. |
|           | While terminating, the server is in the **Terminating** state.                                                                                   |
| delay     | The server waits to terminate until all non-checkpointable, non-rerunnable jobs are finished executing. Any running jobs that can be checkpointed are checkpointed, terminated, and requeued. Jobs that cannot be checkpointed are terminated and requeued if they are rerunnable, otherwise they are allowed to continue to run. |
|           | While terminating, the server is in the **Terminating-Delayed** state.                                                                            |
| quick     | Running jobs are left running. Running subjobs are requeued.                                                                                     |
|           | This is the default behavior when no options are given to the qterm command.                                                                     |
|           | While terminating, the server is in the **Terminating** state.                                                                                   |
| --version | The qterm command returns its PBS version information and exits. This option can only be used alone.                                             |
2.61.4 Operands

The server list operand specifies which servers are to shut down. It is a space-separated list of server names. If no servers are specified, then the default server is shut down.

2.61.4.1 Standard Error

The `qterm` command writes a diagnostic message to standard error for each error occurrence.

2.61.4.2 Exit Status

- Zero upon successful processing of all the operands presented to the `qterm` command.
- Greater than zero if the `qterm` command fails to process any operand.

2.62 tracejob

Prints log messages for a PBS job

2.62.1 Synopsis

```bash
tracejob --version
```

2.62.2 Description

The `tracejob` command extracts log messages for a given `jobid` and prints them in chronological order.

Log messages contain server, scheduler, accounting and MoM information. Server logs contain information such as when a job was queued or modified. Scheduler logs contain clues as to why a job is not running. Accounting logs contain accounting records for when a job was queued, started, ended or deleted. MoM logs contain information about what happened to a job while it was running.
Chapter 2

PBS Commands

To get MoM log messages for a job, \texttt{tracejob} must be run on the machine on which the job ran.

All users have access to server, scheduler and MoM information. Only Administrator or root can access accounting information.

Some log messages appear many times. In order to make the output of \texttt{tracejob} more readable, messages that appear over a certain number of times (see option \texttt{-c} below) are restricted to only the most recent message.

If \texttt{tracejob} is run on a job array, the information returned will be about the job array itself, and not its subjobs. Job arrays do not have associated MoM log messages. If \texttt{tracejob} is run on a subjob, the same types of log messages will be available as for a job. Certain log messages that occur for a regular job will not occur for a subjob.

Note that some shells require that you enclose a job array identifier in double quotes.

\section*{2.62.3 Options to tracejob}

\begin{itemize}
  \item \texttt{-a}
    \begin{itemize}
      \item Do not report accounting information.
    \end{itemize}
  \item \texttt{-c <count>}
    \begin{itemize}
      \item Set excessive message limit to \texttt{count}. If a message is logged at least \texttt{count} times, only the most recent message is printed.
      \item The default for \texttt{count} is 15.
    \end{itemize}
  \item \texttt{-f <filter>}
    \begin{itemize}
      \item Do not include log events of type \texttt{filter}. The \texttt{-f} option can be used more than once on the command line.
      \item Filter values:
        \begin{itemize}
          \item Filter values can be any of: \texttt{error, system, admin, job, job\_usage, security, sched, debug, debug2, resv, debug3, or debug4}, or their equivalent in hexadecimal. The following table shows the hex value and category for each filter.
        \end{itemize}
    \end{itemize}
\end{itemize}

\begin{table}[h]

<td>Less common than debug3</td>
</tr>
</tbody>
</table>

-l
Do not report scheduler information.

-m
Do not report MoM information.

-n <days>
Report information from up to days days in the past.
Default is 1 = today.

-p <path>
Use path as path to PBS_HOME on machine being queried.

-s
Do not report server information.

-w <cols>
Width of current terminal. If not specified by the user, tracejob queries OS to get terminal width. If OS doesn’t return anything, default is 80.

-v
Verbose. Report more of tracejob’s errors than default.

-z
Suppresses printing of duplicate messages.
--version
The tracejob command returns its PBS version information and exits. This option can only be used alone.

2.62.4 Exit Status

- Zero upon successful processing of all options.
- Exit value is greater than zero if tracejob is unable to process any options.

The PBS Professional Administrator’s Guide
pbs_server(8B), pbs_sched(8B), pbs_mom(8B)

2.63 xpbs

Deprecated. GUI front end to PBS commands

2.63.1 Synopsis

xpbs [-admin]
xpbs --version

2.63.2 Description

The xpbs command provides a user-friendly point-and-click interface to PBS commands. Please see the sections below for a tour and tutorials. Also, within every dialog box, a Help button can be found for assistance.

2.63.3 Options

-admin
A mode where additional buttons are made available for terminating PBS servers, starting/stoping/disabling/enabling queues, and running/rerunning jobs.

--version
The xpbs command returns its PBS version information and exits. This option can only be used alone.
2.63.4 Getting Started

Running \texttt{xpbs} will initialize the X resource database from various sources in the following order:

1. The \texttt{RESOURCE\_MANAGER} property on the root window (updated via \texttt{xrdb}) with settings usually defined in the \texttt{.Xdefaults} file
2. Preference settings defined by the system administrator in the global \texttt{xpbsrc} file
3. User’s \texttt{~/.xpbsrc} file - this file defines various X resources like fonts, colors, list of PBS hosts to query, criteria for listing queues and jobs, and various view states. See section 2.63.13, “Setting Preferences”, on page 262 below for a list of resources that can be set.

2.63.5 Running \texttt{xpbs}

To run \texttt{xpbs} as a regular, non-privileged user, type:

\begin{verbatim}
setenv DISPLAY <display_host>:0
xpbs
\end{verbatim}

To run \texttt{xpbs} with the additional purpose of terminating PBS servers, stopping and starting queues, or running/rerunning jobs, then run:

\begin{verbatim}
xpbs -admin
\end{verbatim}

NOTE: Be sure to appropriately set \texttt{~/.rhosts} file if you’re planning to submit jobs to some remote server, and expecting output files to be returned to the local host (where \texttt{xpbs} was run). Usually, adding the PBS hostname running the server to your \texttt{.rhosts} file locally, and adding the name of the local machine to the \texttt{.rhosts} file at remote host, should be sufficient.

Also, be sure that the PBS client commands are in the default \texttt{PATH} because \texttt{xpbs} will call these commands.
2.63.6 The \texttt{xpbs} Display

This section describes the main parts of the \texttt{xpbs} display. The main window is composed of 5 distinct areas (subwindows) arranged vertically (one on top of another) in the following order:

1. Menu
2. Hosts
3. Queues
4. Jobs
5. Info

2.63.6.1 Menu

The Menu area is composed of a row of command buttons that signal some action with a click of the left mouse button. The buttons are:

- **Manual Update**
  to update the information on hosts, queues, and jobs.

- **Auto Update**
  same as Manual Update except updating is done automatically every \(<\text{some specified}\>\) number of minutes.

- **Track Job**
  for periodically checking for returned output files of jobs.

- **Preferences**
  for setting certain parameters such as the list of server host(s) to query.

- **Help**
  contains some help information.

- **About**
  tells of the author and who to send comments, bugs, suggestions to.

- **Close**
  for exiting \texttt{xpbs} plus saving the current setup information (if anything had changed) in the user’s \$HOME/\texttt{.xpbsrc} file. Information saved include the selected host(s), queue(s), job(s), the different jobs listing criteria, the view states (i.e. minimized/maximized) of the Hosts, Queues, Jobs, and INFO regions, and anything in the Preferences section.
2.63.6.2 Hosts

The Hosts area is composed of a leading horizontal HOSTS bar, a listbox, and a set of command buttons. The HOSTS bar contains a minimize/maximize button, identified by a dot or a rectangular image, for displaying or iconifying the Hosts region. The listbox displays information about favorite server host(s), and each entry is meant to be selected via a single left mouse button click, shift key + mouse button 1 click for contiguous selection, or ctrl key + mouse button 1 click for non-contiguous selection. The command buttons represent actions on selected host(s), and commonly found buttons are:

- **detail**
  for obtaining detailed information about selected server host(s). This functionality can also be achieved by double clicking on an entry in the Hosts listbox.

- **Submit**
  for submitting a job to any of the queues managed by the selected host(s).

- **terminate**
  for terminating PBS servers on selected host(s). (-admin only)

The server hosts can be chosen by specifying in the ~/.xpbsrc file (or .Xdefaults) the resource:

```
*serverHosts: hostname1 hostname2 ...
```

Another way of specifying the host is to click on the Preferences button in the Menu region, and manipulate the server Hosts entry widget from the preferences dialog box.

2.63.6.3 Queues

The Queues area is composed of a leading horizontal QUEUES bar, a listbox, and a set of command buttons. The QUEUES bar lists the hosts that are consulted when listing queues; the bar also contains a minimize/maximize button for displaying or iconifying the Queues region. The listbox displays information about queues managed by the server host(s) selected from the Hosts listbox; each listbox entry is meant to be selected (highlighted) via a single left mouse button click, shift key + mouse button 1 click for contiguous selection, or ctrl key + mouse button 1 click for non-contiguous selection. The command buttons represent actions for operating on selected queue(s), and commonly found buttons are:

- **detail**
  for obtaining detailed information about selected queue(s). This functionality can also be achieved by double clicking on a Queues listbox entry.

- **stop**
  for stopping the selected queue(s). (-admin only)
Chapter 2  

PBS Commands

start
   for starting the selected queue(s).  (-admin only)

disable
   for disabling the selected queue(s).  (-admin only)

enable
   for enabling the selected queue(s).  (-admin only)

2.63.6.4  Jobs

The Jobs area is composed of a leading horizontal JOBS bar, a listbox, and a set of command buttons. The JOBS bar lists the queues that are consulted when listing jobs; the bar also contains a minimize/maximize button for displaying or iconifying the Jobs region. The listbox displays information about jobs that are found in the queue(s) selected from the Queues listbox; each listbox entry is meant to be selected (highlighted) via a single left mouse button click, shift key + mouse button 1 click for contiguous selection, or cntrl key + mouse button 1 click for non-contiguous selection. The region just above the Jobs listbox shows a collection of command buttons whose labels describe criteria used for filtering the Jobs listbox contents.

The list of jobs can be selected according to the owner of jobs (Job_Owner), job state (Job_State), name of the job (Job_Name), type of hold placed on the job (Hold_Types), the account name associated with the job (Account_Name), checkpoint attribute (Checkpoint), time the job is eligible for queueing/execution (Queue_Time), resources requested by the job (Resource_List), priority attached to the job (Priority), and whether or not the job is rerunnable (Rerunnable). The selection criteria can be modified by clicking on any of the appropriate command buttons to bring up a selection box. The criteria command buttons are accompanied by a Select Jobs button, which when clicked, will update the contents of the Jobs listbox based on the new selection criteria. Please see qselect(1B) for more details on how the jobs are filtered.

Finally, to the right of the listbox, the Jobs region is accompanied by the following command buttons, for operating on selected job(s):

detail
   for obtaining detailed information about selected job(s).  This functionality can also be achieved by double clicking on a Jobs listbox entry.

modify
   for modifying attributes of the selected job(s).

delete
   for deleting the selected job(s).

hold
   for placing some type of hold on selected job(s).
release
  for releasing held job(s).

signal
  for sending signals to selected job(s) that are running.

msg
  for writing a message string into the output streams of the selected job(s).

move
  for moving selected job(s) into some specified destination queue.

order
  for exchanging order of two selected jobs in a queue.

run
  for running selected job(s).  (-admin only)

rerun
  for requeuing selected job(s) that are running.  (-admin only)

2.63.6.5  Info

The Info Area shows the progress of the commands' executed by xpbs. Look into this box for errors. The INFO bar also contains a minimize/maximize button for displaying or iconifying the Info region.

2.63.7  Widgets Used in xpbs

Some of the widgets used in xpbs and how they are manipulated are described in the following:
2.63.7.1 listbox

Can be multi-selectable (a number of entries can be selected/highlighted using a mouse click) or single-selectable (one entry can be highlighted at a time). For a multi-selectable listbox, the following operations are allowed:

1. single click with mouse button 1 to select/highlight an entry.
2. shift key + mouse button 1 to contiguously select more than one entry.
3. cntrl key + mouse button 1 to non-contiguously select more than one entry. NOTE: For systems running Tk < 4.0, the newly selected item is reshuffled to appear next to already selected items.
4. click the Select All/Deselect All button to select all entries or deselect all entries at once.
5. double clicking an entry usually activates some action that uses the selected entry as a parameter.

2.63.7.2 scrollbar

usually appears either vertically or horizontally and contains 5 distinct areas that are mouse clicked to achieve different effects:

top arrow
Causes the view in the associated widget to shift up by one unit (i.e. the object appears to move down one unit in its window). If the button is held down the action will auto-repeat.

top gap
Causes the view in the associated window to shift up by one less than the number of units in the window (i.e. the portion of the object that used to appear at the very top of the window will now appear at the very bottom). If the button is held down the action will auto-repeat.

slider
Pressing button 1 in this area has no immediate effect except to cause the slider to appear sunken rather than raised. However, if the mouse is moved with the button down then the slider will be dragged, adjusting the view as the mouse is moved.

bottom gap
Causes the view in the associated window to shift down by one less than the number of units in the window (i.e. the portion of the object that used to appear at the very bottom of the window will now appear at the very top). If the button is held down the action will auto-repeat.
bottom arrow
Causes the view in the associated window to shift down by one unit (i.e., the object appears to move up one unit in its window). If the button is held down the action will auto-repeat.

2.63.7.3 entry
brought into focus with a click of the left mouse button. To manipulate this widget, simply type in the text value. Use of arrow keys, mouse selection of text for deletion or overwrite, copying and pasting with sole use of mouse buttons are permitted. This widget is usually accompanied by a scrollbar for horizontally scanning a long text entry string.

2.63.7.4 matrix of entry boxes
usually shown as several rows of entry widgets where a number of entries (called fields) can be found per row. The matrix is accompanied by up/down arrow buttons for paging through the rows of data, and each group of fields gets one scrollbar for horizontally scanning long entry strings. Moving from field to field can be done using the <Tab>, <Cntrl-f>, or <Cntrl-b> (move backwards) keys.

2.63.7.5 spinbox
a combination of an entry widget and a horizontal scrollbar. The entry widget will only accept values that fall within a defined list of valid values, and incrementing through the valid values is done by clicking on the up/down arrows.

2.63.7.6 button
a rectangular region appearing either raised or pressed that invokes an action when clicked with the left mouse button. When the button appears pressed, then hitting the <RETURN> key will automatically select the button.

2.63.7.7 text
an editor like widget. This widget is brought into focus with a click of the left mouse button. To manipulate this widget, simply type in the text. Use of arrow keys, backspace/delete key, mouse selection of text for deletion or overwrite, copying and pasting with sole use of mouse buttons are permitted. This widget is usually accompanied by a scrollbar for vertically scanning a long entry.
Chapter 2  PBS Commands

2.63.8 Submitting Jobs

Submitting a PBS job requires only to manipulate the widgets found in the Submit window. The submit dialog box is composed of 4 distinct regions:

1. Job Script
2. Options
3. OTHER Options
4. Command Buttons

The Job Script file region is at the upper left, the Options region containing various widgets for setting job attributes is scattered all over the dialog box, the OTHER Options is located just below the Job Script file region, and Command Buttons region is at the bottom.

The job script region is composed of a header box, the text box, FILE entry box, and a couple of buttons labeled load and save. If you have a script file containing PBS options and executable lines, then type the name of the file on the FILE entry box, and then click on the load button. The various widgets in the Submit window will get loaded with values found in the script file. The script file text box will only be loaded with executable lines (non-PBS) found in the script. The job script header box has a Prefix entry box that can be modified to specify the PBS directive to look for when parsing a script file for PBS options. If you don’t have a script file, you can start typing the executable lines of the job in the file text box.

To submit a job, perform the following steps:

1. Select a host from the HOSTS listbox in the main xpbs display.
2. Click on the Submit button located in the Menu bar.
3. Specify the script file containing the job execution lines and job resource and attribute values, or simply type in the execution lines in the FILE textbox.
4. Start manipulating the various widgets in the Submit window. Particularly, pay close attention to the Destination listbox. This box lists all the queues found in the host that you selected. A special entry called “@host” refers to the default queue at host. Select appropriately the destination queue of the job. More options can be found by clicking the OTHER Options buttons.
5. At the bottom of the Submit window, click confirm submit. You can also click on interactive to run the job interactively. Running a job interactively will open an xterm window to your display host containing the session.

NOTE: The script FILE entry box is accompanied by a save button that you click to save the current widget values to the specified file in a form that can later be read by xpbs or by the qsub command.

RG-260  PBS Professional 13.0 Reference Guide
2.63.9 Modifying Attributes of Jobs

Modifying a PBS job requires only to manipulate the widgets found in the Modify window. To modify a job or jobs, do the following steps:

1. Select one or more jobs from the JOBS listbox in the main xpbs display.
2. Click on the modify button located to the right of the listbox.
3. The Modify window is structured similarly to the Submit window. Simply manipulate the widgets to specify replacement or additional values of job attributes.
4. Click on the confirm modify button located at the bottom of the dialog box.

2.63.10 Deleting Jobs

Deleting a PBS job requires only to manipulate the widgets found in the Delete window. To delete a job or jobs, do the following steps:

1. Select one or more jobs from the JOBS listbox in the main xpbs display.
2. Click on the delete button located to the right of the listbox.
3. Manipulate the spinbox widget to set the kill delay signal interval.
4. Click on the delete button located at the bottom of the dialog box.

2.63.11 Tracking Returned Output Files

If you want to be informed of returned output files of current jobs, and be able to quickly see the contents of those files, then enable the “track job” feature as follows:

1. Submit all the jobs that you want monitored.
2. Click on the Track Job button located in the Menu bar to bring up the Track Job dialog box.
3. Specify the list of user names, whose jobs are to be monitored for returned output files, in the matrix located at the upper left of the dialog box.
4. Manipulate the minutes spinbox, located just below the user names matrix, to specify the interval value when output files will be periodically checked.
5. Specify the location of job output files (whether locally or remotely) by clicking on one of the radio buttons located at the upper right of the dialog box. Returned locally means the output files will be returned back to the host where xpbs was run. If the output files are returned to some remote host, then xpbs will execute an RSH <remote_host> test -f
Chapter 2  

PBS Commands

<output_files> to test the existence of the files. RSH is whatever you set the remote shell
command to in the corresponding entry box.

NOTE: Be sure the files are accessible from the host where xpbs was run (i.e. .rho-
sts appropriately set).

6. Click start/reset tracking button located at the bottom of the dialog box to:
   • cancel any previous tracking
   • build a new list of jobs to be monitored for returned output files based on currently
     queued jobs.
   • start periodic tracking.

7. Click on close window button.

When an output file for a job being monitored is found, then the Track Job button (the one that
originally invoked the Track Job dialog box) will turn into a different color, and the Jobs
Found Completed listbox, located in the Track Job dialog box, is then loaded with the corre-
sponding job id(s). Then double click on a job id to see the contents of the output file and the
error file. Click stop tracking if you want to cancel tracking.

2.63.12  Leaving xpbs

Click on the Close button located in the Menu bar to leave xpbs. If anything had changed, it
will bring up a dialog box asking for a confirmation in regards to saving state information like
the view states (minimize/maximize) of the HOSTS, QUEUES, JOBS, and INFO subwin-
dows, and various criteria for listing queues and jobs. The information is saved in ~/.xpbsrc
file.

2.63.13  Setting Preferences

The resources that can be set in the X resources file, ~/.xpbsrc, are:

*serverHosts
   list of server hosts (space separated) to query by xpbs keyword
   PBS_DEFAULT_SERVER can be used which will be used as a place holder for the
   value obtained from *defServerFile.

*defServerFile
   the file containing the name of the default server host. The content of this will be
   substituted for the PBS_DEFAULT_SERVER keyword in *serverHosts value.

*timeoutSecs
   specify the number of seconds before timing out waiting for a connection to a PBS
   host.
PBS Commands

* xtermCmd
  the xterm command to run driving an interactive PBS session.

* labelFont
  font applied to text appearing in labels.

* fixlabelFont
  font applied to text that label fixed-width widgets such as listbox labels. This must be a fixed-width font.

* textFont
  font applied to a text widget. Keep this as fixed-width font.

* backgroundColor
  the color applied to background of frames, buttons, entries, scrollbar handles.

* foregroundColor
  the color applied to text in any context (under selection, insertion, etc...).

* activeColor
  the color applied to the background of a selection, a selected command button, or a selected scrollbar handle.

* disabledColor
  color applied to a disabled widget.

* signalColor
  color applied to buttons that signal something to the user about a change of state. For example, the color of the Track Job button when returned output files are detected.

* shadingColor
  a color shading applied to some of the frames to emphasize focus as well as decoration.

* selectorColor
  the color applied to the selector box of a radio button or check-button.

* selectHosts
  list of hosts (space separated) to automatically select/highlight in the HOSTS listbox.

* selectQueues
  list of queues (space separated) to automatically select/highlight in the QUEUES listbox.
*selectJobs
list of jobs (space separated) to automatically select/highlight in the JOBS listbox.

*selectOwners
list of owners checked when limiting the jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Owners: <list_of_owners>}”. See -u option in \texttt{qselect(1B)} for format of <list_of_owners>.

*selectStates
list of job states to look for (do not space separate) when limiting the jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Job\_States: <states_string>}”. See -s option in \texttt{qselect(1B)} for format of <states_string>.

*selectRes
list of resource amounts (space separated) to consult when limiting the jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Resources: <res_string>}”. See -l option in \texttt{qselect(1B)} for format of <res_string>.

*selectExecTime
the Execution Time attribute to consult when limiting the list of jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Queue\_Time: <exec_time>}”. See -a option in \texttt{qselect(1B)} for format of <exec_time>.

*selectAcctName
the name of the account that will be checked when limiting the jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Account\_Name: <account_name>}”. See -A option in \texttt{qselect(1B)} for format of <account_name>.

*selectCheckpoint
the checkpoint attribute relationship (including the logical operator) to consult when limiting the list of jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Checkpoint: <checkpoint_arg>}”. See -c option in \texttt{qselect(1B)} for format of <checkpoint_arg>.

*selectHold
the hold types string to look for in a job when limiting the jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Hold\_Types: <hold_string>}”. See -h option in \texttt{qselect(1B)} for format of <hold_string>.

*selectPriority
the priority relationship (including the logical operator) to consult when limiting the list of jobs appearing on the Jobs listbox in the main \texttt{xpbs} window. Specify value as “\textit{Priority: <priority_value>}”. See -p option in \texttt{qselect(1B)} for format of <priority_value>. 
*selectRerun
the rerunnable attribute to consult when limiting the list of jobs appearing on the
Jobs listbox in the main xpbs window. Specify value as “Rerunnable:
<rerun_val>”. See -r option in qselect(1B) for format of <rerun_val>.

*selectJobName
name of the job that will be checked when limiting the jobs appearing on the Jobs
listbox in the main xpbs window. Specify value as “Job_Name: <jobname>”. See
-N option in qselect(1B) for format of <jobname>.

*iconizeHostsView
a boolean value (True or False) indicating whether or not to iconify the HOSTS
region.

*iconizeQueuesView
a boolean value (True or False) indicating whether or not to iconify the QUEUES
region.

*iconizeJobsView
a boolean value (True or False) indicating whether or not to iconify the JOBS
region.

*iconizeInfoView
a boolean value (True or False) indicating whether or not to iconify the INFO
region.

*jobResourceList
a curly-braced list of resource names as according to architecture known to xpbs.
The format is as follows:
{ <arch-type1> resname1 resname2 ... resnameN }
{ <arch-type2> resname1 resname2 ... resnameN }

. . .
{ <arch-typeN> resname1 resname2 ... resnameN }

2.63.14 xpbs and PBS Commands

xpbs calls PBS commands as follows:

<table>
<thead>
<tr>
<th>Command Button</th>
<th>PBS Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail (Hosts)</td>
<td>qstat -B -f &lt;selected server_host(s)&gt;</td>
</tr>
</tbody>
</table>
### 2.63.15 Exit Status

- Upon successful processing, the `xpbs` exit status will be a value of zero.
- If the `xpbs` command fails, the command exits with a value greater than zero.

<table>
<thead>
<tr>
<th>Command Button</th>
<th>PBS Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminate</td>
<td><code>qterm &lt;selected server_host(s)&gt;</code></td>
</tr>
<tr>
<td>detail (Queues)</td>
<td><code>qstat -Q -f &lt;selected queue(s)&gt;</code></td>
</tr>
<tr>
<td>stop</td>
<td><code>qstop &lt;selected queue(s)&gt;</code></td>
</tr>
<tr>
<td>start</td>
<td><code>qstart &lt;selected queue(s)&gt;</code></td>
</tr>
<tr>
<td>enable</td>
<td><code>qenable &lt;selected queue(s)&gt;</code></td>
</tr>
<tr>
<td>disable</td>
<td><code>qdisable &lt;selected queue(s)&gt;</code></td>
</tr>
<tr>
<td>detail (Jobs)</td>
<td><code>qstat -f &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>modify</td>
<td><code>qalter &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>delete</td>
<td><code>qdel &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>hold</td>
<td><code>qhold &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>release</td>
<td><code>qrls &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>run</td>
<td><code>qrun &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>rerun</td>
<td><code>qrerun &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>signal</td>
<td><code>qsig &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>msg</td>
<td><code>qmsg &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>move</td>
<td><code>qmove &lt;selected job(s)&gt;</code></td>
</tr>
<tr>
<td>order</td>
<td><code>qorder &lt;selected job(s)&gt;</code></td>
</tr>
</tbody>
</table>

2.64  xpbsmon

*Deprecated.* GUI for displaying, monitoring execution hosts under PBS

2.64.1  Synopsis

```
xpbsmon
```

```
xpbsmon --version
```

2.64.2  Description

The `xpbsmon` command provides a way to graphically display the various nodes that run jobs. A node or execution host can be running a `pbs_mom` daemon, or not running the daemon. For the latter case, it could just be a nodename that appears in a nodes file that is managed by a main `pbs_server` running on another host. This utility also provides the ability to monitor values of certain system resources by posting queries to the `pbs_mom` of a node. With this utility, you can see what job is running on what node, who owns the job, how many nodes assigned to a job, status of each node (color-coded and the colors are user-modifiable), how many nodes are available, free, down, reserved, offline, of unknown status, in use running multiple jobs or executing only 1 job. Please see the sections below for a tour and tutorials of `xpbsmon`. Also, within every dialog box, a Help button can be found for assistance.
2.64.3 Getting Started

Running \texttt{xpbsmon} will initialize the X resource database from various sources in the following order:

1. The \texttt{RESOURCE_MANAGER} property on the root window (updated via \texttt{xrdb}) with settings usually defined in the \texttt{.Xdefaults} file
2. Preference settings defined by the system administrator in the global \texttt{xpbsmonrc} file
3. User’s \texttt{~/.xpbsmonrc} file - this file defines various X resources like fonts, colors, list of colors to use to represent the various status of the nodes, list of PBS sites to query, list of server hosts on each site, list of nodes/execution hosts on each server host, list of system resource queries to send to the nodes’ \texttt{pbs_mom}, and various view states. See section 2.64.10, “Setting Preferences”, on page 275 below for a list of resources that can be set.

2.64.4 Running \texttt{xpbsmon}

\texttt{xpbsmon} can be run either as a regular user or superuser. If you run it with less privilege, you may not be able to see all the information for a node. If it is executed as a regular user, you should still be able to see what jobs are running on what nodes, possibly state, as this information are obtained by \texttt{xpbsmon} talking directly to the specified server. If you want other system resource values, it may require special privilege since \texttt{xpbsmon} will have to talk directly to the \texttt{pbs_mom} of a node. In addition, the host where \texttt{xpbsmon} was running must also have been given explicit access permission by the MoM (unless the GUI is running on the same host where MoM is running). This is done done by updating the \texttt{$clienthost} and/or the \texttt{$restricted} parameter on the MoM’s configuration file.

To run \texttt{xpbsmon}, type:

\begin{verbatim}
setenv DISPLAY <display_host>:0
xpbsmon
\end{verbatim}

If you are running the GUI and only interested in jobs data, then be sure to set all the nodes’ type to NOMOM in the Pref dialog box.

2.64.5 Options

--version

The \texttt{xpbsmon} command returns its PBS version information and exits. This option can only be used alone.
2.64.6 The xpbsmon Display

This section describes the main parts of the xpbsmon display. The main window is composed of 3 distinct areas (subwindows) arranged vertically (one on top of another) in the following order:

1. Menu
2. Site Information
3. Info

2.64.6.1 Menu

The Menu area is composed of a row of command buttons that signal some action with a click of the left mouse button. The buttons are:

Site.. displays a popup menu containing the list of PBS sites that have been added using the Sites Preferences window. Simply drag your mouse and release to the site name whose servers/nodes information you would like to see.

Pref.. brings up various dialog boxes for specifying the list of sites, servers on each site, nodes that are known to a server, and the system resource queries to be sent to a node’s pbs_mom daemon.

Auto Update.. brings up another window for specifying whether or not to do auto updates of nodes information, and also for specifying the interval number of minutes between updates.

Help contains some help information.

About tells who the author is and who to send comments, bugs, suggestions to.

Close for exiting xpbsmon plus saving the current setup information (if anything had changed) in the user’s $HOME/.xpbsmonrc file. Information saved include the specified list of sites, servers on each site, nodes known to each server, and system resource queries to send to node’s pbs_mom.

Minimize Button shows the iconified view of Site Information where nodes are represented as tiny boxes, where each box is colored according to status. In order to get more information about a node, you need to double click on the colored box.
Maximize button shows the full view of Site Information where nodes are represented in bigger boxes, still colored depending on the status, and some information on it is displayed.

2.64.6.2 Site Information

Only one site at a time can be displayed. This area (shown as one huge box referred to as the site box) can be further subdivided into 3 areas: the site name label at the top, server boxes in the middle, and the color status bar at the bottom. The site name label shows the name of the site as specified in the Pref. window. At the middle of the site box shows a row of big boxes housing smaller boxes.

The big box is an abstraction of a server host (called a server box), showing its server display label at the top of the box, a grid of smaller boxes representing the nodes that the server knows about (where jobs are run), and summary status for the nodes under the server. Status information will show counters for the number of nodes used, available, reserved, offline, or of unknown status and even # of cpus assigned. For a cleaner display, some counters with a value of zero are not displayed. The server boxes are placed in a grid, with a new row being started when either *siteBoxMaxNumServerBoxesPerRow or *siteBoxMaxWidth limit has been reached.

The smaller boxes represent the nodes/execution hosts where jobs are run (referred to as node boxes). Each node box shows the name at the top, and a sub-box (a smaller square) that is colored according to the status of the node that it represents, and if the view type is FULL, it will display some node information according to the system resource queries specified on the Pref. window. Clicking on the sub-box will show a much bigger box (called the MIRROR view) with bigger fonts containing nodes information. Another view is called ICON and this shows a tiny box with a colored area. The node boxes are arranged in a grid, where a new row is created if either the *serverBoxMaxNumNodeBoxesPerRow or *serverBoxMaxWidth limit has been reached. ICON view of the node boxes will be constrained by the *nodeBoxIconMaxHeight and *nodeBoxIconMaxWidth pixel values; FULL view of the node boxes will be bounded by *nodeBoxFullMaxWidth and *nodeBoxFullMaxHeight; the mirror view of the node boxes has its size be *nodeBoxMirrorMaxWidth, and *nodeBoxMirrorMaxHeight.

Horizontal and vertical scrollbars for the site box, server box, and node box will be displayed as needed.

Finally, the color bar information shows a color chart displaying what the various colors mean in terms of node status. The color-to-status mapping can be modified by setting the X resources: *nodeColorNOINFO, *nodeColorFREE, *nodeColorINUSEshared, *nodeColorINUSEexclusive, *nodeColorDOWN, *nodeColorRSVD, *nodeColorOFFL, *nodeColorBUSY.
2.64.6.3  Info

The Info Area shows the progress of some of the background actions performed by `xpbsmon`. Look into this box for errors.

2.64.7  Widgets Used in `xpbsmon`

Some of the widgets used in `xpbsmon` and how they are manipulated are described in the following:

2.64.7.1  listbox

The ones found in this GUI are only single-selectable (one entry can be highlighted/selected at a time via a mouse click).

2.64.7.2  scrollbar

Usually appears either vertically or horizontally and contains 5 distinct areas that are mouse clicked to achieve different effects:

- **top arrow**
  Causes the view in the associated widget to shift up by one unit (i.e. the object appears to move down one unit in its window). If the button is held down the action will auto-repeat.

- **top gap**
  Causes the view in the associated window to shift up by one less than the number of units in the window (i.e. the portion of the object that used to appear at the very top of the window will now appear at the very bottom). If the button is held down the action will auto-repeat.

- **slider**
  Pressing button 1 in this area has no immediate effect except to cause the slider to appear sunken rather than raised. However, if the mouse is moved with the button down then the slider will be dragged, adjusting the view as the mouse is moved.

- **bottom gap**
  Causes the view in the associated window to shift down by one less than the number of units in the window (i.e. the portion of the object that used to appear at the very bottom of the window will now appear at the very top). If the button is held down the action will auto-repeat.
bottom arrow
Causes the view in the associated window to shift down by one unit (i.e. the object appears to move up one unit in its window). If the button is held down the action will auto-repeat.

2.64.7.3 entry
brought into focus with a click of the left mouse button. To manipulate this widget, simply type in the text value. Use of arrow keys, mouse selection of text for deletion or overwrite, copying and pasting with sole use of mouse buttons are permitted. This widget is usually accompanied by a scrollbar for horizontally scanning a long text entry string.

2.64.7.4 box
made up of 1 or more listboxes displayed adjacent to each other giving the effect of a “matrix”. Each row from the listboxes makes up an element of the box. In order to add items to the box, you need to manipulate the accompanying entry widgets, one for each listbox, and then clicking the add button. Removing items from the box is done by selecting an element, and then clicking delete.

2.64.7.5 spinbox
a combination of an entry widget and a horizontal scrollbar. The entry widget will only accept values that fall within a defined list of valid values, and incrementing through the valid values is done by clicking on the up/down arrows.

2.64.7.6 button
a rectangular region appearing either raised or pressed that invokes an action when clicked with the left mouse button. When the button appears pressed, then hitting the <RETURN> key will automatically select the button.
2.64.8 Updating Preferences

2.64.8.1 Time Sharing

Suppose you have a time-sharing environment where the front-end is called bower and you have 4 nodes: bower1, bower2, bower3, bower4. bower is the host that runs the server; jobs are submitted to host bower where it enqueues it for future execution. Also, a pbs_mom daemon is running on each of the execution hosts. If the server bower also maintains a nodes list containing information like state for the 4 nodes, then this will also be reported. Then to setup xpbsmon, do the following:

1. Click the Pref.. button on the Menu section.

2. On the Sites Preference dialog, enter any arbitrary site name, for example “Local”. Then click the add button.

3. On the Server_Host entry box, enter “bower”, and on the DisplayLabel entry box, put an arbitrary label (as it would appear on the header of the server box) like “Bower”, and then click add.

4. Click the nodes.. button that is accompanying the Servers box. This would bring up the Server Preference dialog.

5. Now add the entries “bower1”, “bower2”, “bower3”, “bower4” specifying type MoM for each on the Nodes box.

6. If you need to monitor certain system resource parameters for each of the nodes, you need to specify query expressions containing resource queries to be sent to the individual PBS moms. For example, if you want to obtain memory usage, then select a node from
the Nodes list, click on the query.. button that accompanies the Nodes list, and this would bring up the Query Table dialog. Specify the following input:

Query_Expr: (availmem/totmem) * 100
Display_Info: Memory Usage:
Display_Type: SCALE

The above says to display the result of the “Query_Expr” in a scale widget calibrated over 100. The queries “availmem” and “totmem” will be sent to the PBS mom, and the expression is evaluated upon receiving all results from the mom. If you want to display the result of another query, say “loadave”, directly, then specify the following:

Query_Expr: loadave
Display_Info: Load Average:
Display_Type: TEXT

NOTE: For a list of queries that can be sent to a pbs_mom, please click on the Help button on the Query table window.

2.64.8.2 Jobs Exclusive Environment

Supposing you have a “space non-sharing” environment where the server maintains a list of nodes that it runs jobs on exclusively (one job at a time outstanding per node). Let’s call this server b1. Simply update Preferences information as follows:

1. Click the Pref.. button on the Menu section.
2. On the Sites Preference dialog, enter a site name, for example “B System”. Then click the add button.
3. On the Server_Host entry box, enter “b1”, DisplayLabel entry box type “B1” (or whatever label that you would like to appear on the header of the server box), and then click add.

2.64.8.3 Hybrid Time Sharing/Space Sharing Environment

A cluster of heterogeneous machines, time-sharing or jobs exclusive, could easily be represented in xpbsmon by combining steps in CASE 1 and CASE 2.
2.64.9  Leaving xpbsmon

Click on the Close button located in the Menu bar to leave xpbsmon. If anything had changed, it will bring up a dialog box asking for a confirmation in regards to saving preferences information about list of sites, their view types, list of servers on each site, the list of nodes known to each server, and the list of queries to be sent to the pbs_mom of each node. The information is saved in ~/.xpbsmonrc file.

2.64.10  Setting Preferences

The resources that can be set in the X resources file, ~/.xpbsmonrc, are described in the following:

2.64.10.1  Node Box Properties

Resource names beginning with "*small" or "*node" apply to the properties of the node boxes. A node box is made of an outer frame where the node label sits on top, the canvas (smaller box) is on the middle, and possibly some horizontal/vertical scrollbars.

- **nodeColorNOINFO**
  color of node box when information for the node it represents could not be obtained.

- **nodeColorFREE**
  color of canvas when node it represents is up.

- **nodeColorINUSEshared**
  color when node it represents has more than 1 job running on it, or when node has been marked by the server that manages it as “job-sharing”.

- **nodeColorINUSEexclusive**
  list of colors to assign to a node box when host it represents is running only 1 job, or when node has been marked by the server that manages it as “time-sharing”. xpbsmon will use this list to assign 1 distinct color per job unless all the colors have been exhausted, in which case, colors will start getting assigned more than once in a round-robin fashion.

- **nodeColorDOWN**
  color when node it represents is down.

- **nodeColorRSVD**
  color when node it represents is reserved.

- **nodeColorOFFL**
  color when node it represents is offline.
*nodeColorBUSY
  color when node it represents is busy (high load average).

*smallForeground
  applies to the color of text inside the canvas.

*smallBackground
  applies to the color of the frame.

*smallBorderWidth
  distance (in pixels) from other node boxes.

*smallRelief
  how node box will visually appear (style).

*smallScrollPaneBorderWidth
  significant only in FULL mode, this is the distance of the horizontal/vertical scrollbars from the canvas and lower edge of the frame.

*smallScrollPaneBackground
  background color of the scrollbars

*smallScrollPaneRelief
  how scrollbars would visually appear (style).

*smallCanvasBackground
  color of the canvas (later overridden depending on status of the node it represents)

*smallCanvasBorderWidth
  distance of the canvas from the frame and possibly the scrollbars.

*smallCanvasRelief
  how the canvas is visually represented (style).

*smallLabelBorderWidth
  the distance of the node label from the canvas and the topmost edge of the frame.

*smallLabelBackground
  the background of the area of the node label that is not filled.

*smallLabelRelief
  how the label would appear visually (style).

*smallLabelForeground
  the color of node label text.

*smallLabelFont
  the font to use for the node label text.

*smallLabelFontWidth
  font width (in pixels) of *smallLabelFont
*smallLabelFontHeight
  font height (in pixels) of *smallLabelFont

*smallTextFont
  font to use for the text that appear inside a canvas.

*smallTextFontWidth
  font width (in pixels) of *smallTextFont.

*smallTextFontHeight
  font height (in pixels) of *smallTextFont.

*nodeColorTrough
  color of trough part (the /100 portion) of a canvas scale item.

*nodeColorSlider
  color of slider part (value portion) of a canvas scale item.

*nodeColorExtendedTrough
  color of extended trough (over 100 portion when value exceeds max) of a canvas scale item.

*nodeScaleFactor
  tells how much bigger you want the scale item on the canvas to appear. (1 means to keep size as is)

*nodeBoxFullMaxWidth
  maximum width (in pixels) of a node box in FULL mode.

*nodeBoxFullMaxHeight
  maximum width and height (in pixels) of a node box in FULL mode.

*nodeBoxIconMaxWidth
  maximum width (in pixels) of a node box in ICON mode.

*nodeBoxIconMaxHeight
  maximum width and height (in pixels) of a node box in ICON mode.

*nodeBoxMirrorMaxWidth
  maximum width and height (in pixels) of a node box displayed on a separate window (after it has been clicked with the mouse to obtain a bigger view)

*nodeBoxMirrorMaxHeight
  maximum width and height (in pixels) of a node box displayed on a separate window (after it has been clicked with the mouse to obtain a bigger view)

*nodeBoxMirrorScaleFactor
  tells how much bigger you want the scale item on the canvas to appear while the node box is displayed on a separate window (1 means to keep size as is)
2.64.10.2 Server Box Properties

Resource names beginning with "*medium" apply to the properties of the server boxes. A server box is made of an outer frame where the server display label sits on top, a canvas filled with node boxes is on the middle, possibly some horizontal/vertical scrollbars, and a status label at the bottom.

*mediumLabelForeground
    color of text applied to the server display label and status label.

*mediumLabelBackground
    background color of the unfilled portions of the server display label and status label.

*mediumLabelBorderWidth
    distance of the server display label and status label from other parts of the server box.

*mediumLabelRelief
    how the server display label and status label appear visually (style).

*mediumLabelFont
    font used for the text of the server display label and status label.

*mediumLabelFontWidth
    font width (in pixels) of *mediumLabelFont.

*mediumLabelFontHeight
    font height (in pixels) of *mediumLabelFont.

*mediumCanvasBorderWidth
    the distance of the server box’s canvas from the label widgets.

*mediumCanvasBackground
    the background color of the canvas.

*mediumCanvasRelief
    how the canvas appear visually (style).

*mediumScrollBorderWidth
    distance of the scrollbars from the other parts of the server box.

*mediumScrollBackground
    the background color of the scrollbars

*mediumScrollRelief
    how the scrollbars appear visually.

*mediumBackgroundColor
    the color of the server box frame.

*mediumBorderWidth
    the distance of the server box from other boxes.
*mediumRelief
  how the server box appears visually (style).

*serverBoxMaxWidth
*serverBoxMaxHeight
  maximum width and height (in pixels) of a server box.

*serverBoxMaxNumNodeBoxesPerRow
  maximum # of node boxes to appear in a row within a canvas.

### 2.64.10.3 Miscellaneous Properties

Resource names beginning with “*big” apply to the properties of a site box, as well as to widgets found outside of the server box and node box. This includes the dialog boxes that appear when the menu buttons of the main window are manipulated. The site box is the one that appears on the main region of xpbsmon.

*bigBackground
  background color of the outer layer of the main window.

*bigForeground
  color applied to regular text that appear outside of the node box and server box.

*bigBorderWidth
  distance of the site box from the menu area and the color information area.

*bigRelief
  how the site box is visually represented (style)

*bigActiveColor
  the color applied to the background of a selection, a selected command button, or a selected scroll bar handle.

*bigShadingColor
  a color shading applied to some of the frames to emphasize focus as well as decoration.

*bigSelectorColor
  the color applied to the selector box of a radiobutton or checkbutton.

*bigDisabledColor
  color applied to a disabled widget.

*bigLabelBackground
  color applied to the unfilled portions of label widgets.

*bigLabelBorderWidth
  distance from other widgets of a label widget.
**bigLabelRelief**
how label widgets appear visually (style)

**bigLabelFont**
font to use for labels.

**bigLabelFontWidth**
font width (in pixels) of *bigLabelFont.

**bigLabelFontHeight**
font height (in pixels) of *bigLabelFont.

**bigLabelForeground**
color applied to text that function as labels.

**bigCanvasBackground**
the color of the main region.

**bigCanvasRelief**
how the main region looks like visually (style)

**bigCanvasBorderWidth**
distance of the main region from the menu and info regions.

**bigScrollBorderWidth**
if the main region has a scrollbar, this is its distance from other widgets appearing on the region.

**bigScrollBackground**
background color of the scrollbar appearing outside a server box and node box.

**bigScrollRelief**
how the scrollbar that appears outside a server box and node box looks like visually (style)

**bigTextFontWidth**
the font width (in pixels) of *bigTextFont

**bigTextFontHeight**
the font height (in pixels) of *bigTextFont

**siteBoxMaxWidth**
maximum width (in pixels) of the site box.

**siteBoxMaxHeight**
maximum height (in pixels) of the site box.

**siteBoxMaxNumServerBoxesPerRow**
maximum number of server boxes to appear in a row inside the site box.

**autoUpdate**
if set to *True*, then information about nodes is periodically gathered.
PBS Commands

*autoUpdateMins
the # of minutes between polling for data regarding nodes when *autoUpdate is set.

*siteInView
the name of the site that should be in view

*rcSiteInfoDelimeterChar
the separator character for each input within a curly-bracketed line of input of *siteInfo.

*sitesInfo

{<site1name><sep><site1-display-type><sep><server-name><sep><server-display-label><sep><nodename><sep><nodetype><sep><node-query-expr>}

...{<site2name><sep><site2-display-type><sep><server-name><sep><server-display-label><sep><nodename><sep><nodetype><sep><node-query-expr>}

Information about a site where <site-display-type> can be either {FULL, ICON}, <nodetype> can be {MOM, NOMOM}, and <node-query-expr> has the format:

{ <expr> } {expr-label} <output-format>

where <output-format> could be {TEXT, SCALE}. It’s probably better to use the Pref dialog boxes in order to specify a value for this.

Example:

*rcSiteInfoDelimeterChar ;

*sitesInfo: {NAS;ICON;newton;Newton;newton3;NOMOM} {Langley;FULL;db;DB;db.nas.nasa.gov;MoM;{{ availmem / totmem } * 100} {Memory Usage:} SCALE} {{ loadave / ncpus } * 100} {Cpu Usage:} SCALE} {ncpus {Number of Cpus:} TEXT} {physmem {Physical Memory:} TEXT} {idletime {Idle Time (s):} TEXT} {loadave {Load Avg:} TEXT} {NAS;ICON;newton;Newton;newton4;NOMOM} {NAS;ICON;newton;Newton;newton1;NOMOM} {NAS;ICON;newton;Newton;newton2;NOMOM} {NAS;ICON;b0101;DB;aspasia.nas.nasa.gov;MoM;{{ availmem / totmem } * 100} {Memory Usage:} SCALE} {{ loadave / ncpus } * 100} {Cpu Usage:} SCALE} {ncpus {Number of Cpus:} TEXT} {physmem {Physical Memory:} TEXT} {idletime {Idle Time (s):} TEXT} {loadave {Load Avg:} TEXT} {NAS;ICON;newton;Newton;newton7;NOMOM}
Chapter 2  PBS Commands

2.64.11 Exit Status

• Upon successful processing, the `xpbsmon` exit status will be a value of zero.
• If the `xpbsmon` command fails, the command exits with a value greater than zero.

If `xpbsmon` is querying a host running a server with an incompatible version, you may see the following messages:

  Internal error: pbsstatnode: End of File (15031)

The above message can be safely ignored.

MoM Parameters

This chapter describes the configuration files used by MoM and lists the MoM configuration parameters that are found in the Version 1 MoM configuration file, `PBS_HOME/mom_priv/config`.

3.1 Syntax of MoM Configuration File

The Version 1 MoM configuration file contains parameter settings for the MoM on the local host.

Version 1 configuration files list local resources and initialization values for MoM. Local resources are either static, listed by name and value, or externally-provided, listed by name and command path. Local static resources are for use only by the scheduler. They do not appear in a `pbsnodes -a` query. See the `-c` option to the `pbs_mom` command. Do not change the syntax of the Version 1 configuration file.

Each configuration item is listed on a single line, with its parts separated by white space. Comments begin with a hashmark (`#`).

3.1.1 Externally-provided Resources

Externally-provided resources, for example dynamic resources such as scratch space, use a shell escape to run a command. These resources are described with a name and value, where the first character of the value is an exclamation mark ("!"). The remainder of the value is the path and command to execute.

Parameters in the command beginning with a percent sign ("%") can be replaced when the command is executed. For example, this line in a configuration file describes a resource named "escape":

```
   escape  !echo %xxx %yyy
```
If a query for the "escape" resource is sent with no parameter replacements, the command executed is "echo %xxx %yyy". If one parameter replacement is sent, "escape[xxx=hi there]", the command executed is "echo hi there %yyy". If two parameter replacements are sent, "escape[xxx=hi][yyy=there]", the command executed is "echo hi there". If a parameter replacement is sent with no matching token in the command line, "escape[zzz=snafu]", an error is reported.

3.1.2 Windows Notes

If the argument to a MoM option is a pathname containing a space, enclose it in double quotes as in the following:

```
hostn !"\Program Files\PBS Pro\exec\bin\hostn" host
```

When you edit any PBS configuration file, make sure that you put a newline at the end of the file. The Notepad application does not automatically add a newline at the end of a file; you must explicitly add the newline.

3.2 Contents of MoM Configuration File

Initialization value directives have names beginning with a dollar sign ("$"). They are listed here:
$action <default_action> <timeout> <new_action>

Replaces the default_action for an event with the site-specified new_action. timeout is the time allowed for new_action to run. new_action is the site-supplied script that replaces default_action. This is the complete list of values for default_action:

Table 3-1: How $action is Used

<table>
<thead>
<tr>
<th>default_action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkpoint</td>
<td>Run new_action in place of the periodic job checkpoint, after which the job continues to run.</td>
</tr>
<tr>
<td>checkpoint_abort</td>
<td>Run new_action to checkpoint the job, after which the job must be terminated by the script.</td>
</tr>
<tr>
<td>multinodebusy &lt;timeout&gt; requeue</td>
<td>Used with cycle harvesting and multi-vnode jobs. Changes default behavior when a vnode becomes busy. Instead of allowing the job to run, the job is requeued. Timeout is ignored. The only new_action is requeue.</td>
</tr>
<tr>
<td>restart</td>
<td>Runs new_action in place of restart.</td>
</tr>
<tr>
<td>terminate</td>
<td>Runs new_action in place of SIGTERM or SIGKILL when MoM terminates a job.</td>
</tr>
</tbody>
</table>

$aix_largepagemode <value>
Controls whether large page mode is available for PBS jobs on AIX. Settable by root only.
Format: Boolean.
Default: False.

$alps_client <path>
Cray only. Path to the Cray apbasil command. Must be full path to command.
Format: path to command
Default: None

$alps_release_timeout <timeout>
Cray only. Specifies the amount of time that PBS tries to release an ALPS reservation before giving up. After this amount of time has passed, PBS stops trying to release the ALPS reservation, the job exits, and the job’s resources are released. PBS
Chapter 3  MoM Parameters

sends a HUP to the MoM so that she rereads the ALPS inventory to get the current available ALPS resources.

We recommend that the value for this parameter be twice the value for suspectbegin.

Format: Seconds, specified as positive integer.
Default: 600 (10 minutes)

$checkpoint_path <path>
MoM passes this parameter to the checkpoint and restart scripts. This path can be absolute or relative to PBS_HOME/mom_priv. Overrides default. Overridden by path specified in the pbs_mom --c option and by PBS_CHECKPOINT_PATH environment variable. See "Specifying Checkpoint Path" on page 873 in the PBS Professional Administrator’s Guide.

$clienthost <hostname>
hostname is added to the list of hosts which will be allowed to connect to MoM as long as they are using a privileged port. For example, this will allow the hosts “fred” and “wilma” to connect to MoM:

$clienthost fred
$clienthost wilma

The following hostnames are added to $clienthost automatically: the server, the localhost, and if configured, the secondary server. The server sends each MoM a list of the hosts in the nodes file, and these are added internally to $clienthost. None of these hostnames need to be listed in the configuration file.

Two hostnames are always allowed to connect to pbs_mom, “localhost” and the name returned to MoM by the system call gethostname(). These hostnames do not need to be listed in the configuration file.

The hosts listed as “clienthosts” make up a “sisterhood” of machines. Any one of the sisterhood will accept connections from within the sisterhood. The sisterhood must all use the same port number.

$cpuset_error_action
When using a cpuset-enabled MoM, specifies the action taken when a cpuset creation error occurs. Can take one of the following values:

continue
The error is logged and the job is killed and requeued.

offline
The vnodes on this host for this job are marked offline, and the job is requeued.
MoM Parameters

Format: String
Allowable values: continue, offline
Default: offline

$cputmult <factor>
This sets a factor used to adjust CPU time used by each job. This allows adjustment of time charged and limits enforced where jobs run on a system with different CPU performance. If MoM’s system is faster than the reference system, set factor to a decimal value greater than 1.0. For example:

```
cputmult 1.5
```

If MoM’s system is slower, set factor to a value between 1.0 and 0.0. For example:

```
cputmult 0.75
```

$dce_refresh_delta <delta>
Defines the number of seconds between successive refreshings of a job’s DCE login context. For example:

```
dce_refresh_delta 18000
```

$enforce <limit>
MoM will enforce the given limit. Some limits have associated values, and appear in the configuration file like this:

```
enforce variable_name value
```

See The PBS Professional Administrator’s Guide.

$enforce mem
MoM will enforce each job’s memory limit.

$enforce cpuaverage
MoM will enforce ncpus when the average CPU usage over a job’s lifetime usage is greater than the job’s limit.

$enforce average_trialperiod <seconds>
Modifies cpuaverage. Minimum number of seconds of job walltime before enforcement begins.

Format: Integer
Default: 120

$enforce average_percent_over <percentage>
Modifies cpuaverage. Gives percentage by which a job may exceed its ncpus limit.

Format: Integer
Default: 50
Chapter 3  

MoM Parameters

$enforce average_cpu_factor <factor>
  Modifies cpuaverage. The ncpus limit is multiplied by factor to produce actual limit.
  Format: Float
  Default: 1.025

$enforce cpuburst
  MoM will enforce the ncpus limit when CPU burst usage exceeds the job’s limit.

$enforce delta_percent_over <percentage>
  Modifies cpuburst. Gives percentage over limit to be allowed.
  Format: Integer
  Default: 50

$enforce delta_cpu_factor <factor>
  Modifies cpuburst. The ncpus limit is multiplied by factor to produce actual limit.
  Format: Float
  Default: 1.5

$enforce delta_weightup <factor>
  Modifies cpuburst. Weighting factor for smoothing burst usage when average is increasing.
  Format: Float
  Default: 0.4

$enforce delta_weightdown <factor>
  Modifies cpuburst. Weighting factor for smoothing burst usage when average is decreasing.
  Format: Float
  Default: 0.4

$ideal_load <load>
  Defines the load below which the vnode is not considered to be busy. Used with the $max_load directive.
  Example:
    $ideal_load 1.8
  Format: Float
  No default

RG-288  
PBS Professional 13.0 Reference Guide
$\texttt{jobdir\_root <stage\_directory\_root>}$
Directory under which PBS creates job-specific staging and execution directories. PBS creates a job’s staging and execution directory when the job’s sandbox attribute is set to \texttt{PRIVATE}. If $\texttt{jobdir\_root}$ is unset, it defaults to the job owner’s home directory. In this case the user’s home directory must exist. If $\texttt{stage\_directory\_root}$ does not exist when MoM starts up, MoM will abort. If $\texttt{stage\_directory\_root}$ does not exist when MoM tries to run a job, MoM will kill the job. Path must be owned by root, and permissions must be 1777. On Windows, this directory should have \texttt{Full Control Permission} for the local Administrators group.

Example:

\begin{verbatim}
$\texttt{jobdir\_root /scratch/foo}$
\end{verbatim}

$\texttt{kbd\_idle <idle\_wait> <min\_use> <poll\_interval>}$
Declares that the vnode will be used for batch jobs during periods when the keyboard and mouse are not in use.

\textit{idle\_wait}
\begin{itemize}
\item Time, in seconds, that the workstation keyboard and mouse must be idle before being considered available for batch jobs.
\item Must be set to non-zero value for cycle harvesting to be enabled.
\end{itemize}

Format: Integer
No default

\textit{min\_use}
\begin{itemize}
\item Time, in seconds, during which the workstation keyboard or mouse must continue to be in use before the workstation is determined to be unavailable for batch jobs.
\end{itemize}

Format: Integer
Default: 10

\textit{poll\_interval}
\begin{itemize}
\item Interval, in seconds, at which MoM checks for keyboard and mouse activity.
\end{itemize}

Format: Integer
Default: 1

Example:

\begin{verbatim}
$\texttt{kbd\_idle 1800 10 5}$
\end{verbatim}
$\text{logevent} \ <\text{mask}>$

Sets the mask that determines which event types are logged by \texttt{pbs\_mom}. To include all debug events, use $0xffffffff$.

Log events:

### Table 3-2: Event Classes

<table>
<thead>
<tr>
<th>Name</th>
<th>Hex Value</th>

</tbody>
</table>

$\text{max\_check\_poll} \ <\text{seconds}>$

Minimum value: 1 second
Default: 120 seconds
Format: Integer
$\text{max\_load} <\text{load}> \,[\text{suspend}]

Defines the load above which the vnode is considered to be \textit{busy}. Used with the $\text{ideal\_load}$ directive. No new jobs are started on a \textit{busy} vnode.

The optional suspend directive tells PBS to suspend jobs running on the node if the load average exceeds the $\text{max\_load}$ number, regardless of the source of the load (PBS and/or logged-in users). Without this directive, PBS will not suspend jobs due to load.

We recommend setting this to a slightly higher value than the number of CPUs, for example $\frac{25}{n_{\text{cpus}}}$.

Example:

$\text{max\_load} \,3.5$

Format: Float

Default: number of CPUs on machine

$\text{min\_check\_poll} <\text{seconds}>

Minimum time between polling cycles, in seconds. Must be greater than zero and less than $\text{max\_check\_poll}$. See "Configuring MoM Polling Cycle" on page 57 in the \texttt{PBS Professional Administrator's Guide}. Minimum recommended value: 10 seconds.

Minimum value: 1 second

Default: 10 seconds

Format: Integer

$\text{prologalarm} <\text{timeout}>

Defines the maximum number of seconds the prologue and epilogue may run before timing out.

Example:

$\text{prologalarm} \,30$

Format: Integer

Default: 30

$\text{reject\_root\_scripts} <\text{True}|\text{False}>

When set to \textit{True}, MoM won’t acquire any new hook scripts, and MoM won’t run job scripts that would execute as root or Admin.

Format: \texttt{Boolean}

Default: \texttt{False}
$restart_background <value>
Controls how MoM runs a restart script after checkpointing a job. When this option
is set to True, MoM forks a child which runs the restart script. The child returns
when all restarts for all the local tasks of the job are done. MoM does not block on
the restart. When this option is set to False, MoM runs the restart script and waits
for the result.
Format: Boolean
Default: False

restart_transmogrify <value>
Controls how MoM runs a restart script after checkpointing a job.
When this option is set to True, MoM runs the restart script, replacing the session ID
of the original task’s top process with the session ID of the script.
When this option is set to False, MoM runs the restart script and waits for the result.
The restart script must restore the original session ID for all the processes of each
task so that MoM can continue to track the job.
When this option is set to False and the restart uses an external command, the con-
figuration parameter restart_background is ignored and treated as if it were set to
True, preventing MoM from blocking on the restart.
Format: Boolean
Default: False

restrict_user <value>
Controls whether users not submitting jobs have access to this machine. If value is
True, restrictions are applied.
See restrict_user_exceptions and restrict_user_maxsysid.
Not supported on Windows.
Format: Boolean
Default: False

restrict_user_exceptions <user_list>
Comma-separated list of users who are exempt from access restrictions applied by
restrict_user. Leading spaces within each entry are allowed. Maximum of 10
names.
$\text{restrict\_user\_maxsysid\ <value>}$  
Any user with a numeric user ID less than or equal to value is exempt from restrictions applied by $\text{restrict\_user}$.

If $\text{restrict\_user}$ is on and no value exists for $\text{restrict\_user\_maxsysid}$, PBS looks in /etc/login.defs, if it exists, for the value. Otherwise the default is used.

Format: Integer  
Default: 999

$\text{restricted\ <hostname>}$
The hostname is added to the list of hosts which will be allowed to connect to MoM without being required to use a privileged port. Queries from the hosts in the restricted list are only allowed access to information internal to this host, such as load average, memory available, etc. They may not run shell commands.

Hostnames can be wildcarded. For example, to allow queries from any host from the domain “xyz.com”:

$\text{restricted\ *.xyz.com}$

$\text{suspendsig\ <suspend\_signal>\ [resume\_signal]}$
Alternate signal suspend\_signal is used to suspend jobs instead of SIGSTOP. Optional resume\_signal is used to resume jobs instead of SIGCONT.

$\text{tmpdir\ <directory>}$
Location where each job’s scratch directory will be created.

PBS creates a temporary directory for use by the job, not by PBS. PBS creates the directory before the job is run and removes the directory and its contents when the job is finished. It is scratch space for use by the job. Permission must be 1777 on UNIX/Linux, writable by Everyone on Windows.

Example:

$\text{tmpdir\ /memfs}$  
Default on UNIX: /var/tmp.  
Default on Windows: value of the TMP environment variable.

$\text{usecp\ <hostname:source\_prefix>\ <destination\_prefix>}$
MoM will use /bin/cp to deliver output files when the destination is a network mounted file system, or when the source and destination are both on the local host, or when the source\_prefix can be replaced with the destination\_prefix on hostname.
Both `source_prefix` and `destination_prefix` are absolute pathnames of directories, not files.

Overrides PBS_RCP and PBS_SCP.

Use trailing slashes on both the source and destination. For example:

```
$usecp HostA:/users/work/myproj/ /sharedwork/proj_results/
```

**$vnodedef_additive**

Specifies whether MoM considers a vnode that appeared previously either in the inventory or in a vnode definition file, but that does not appear now, to be in her list of vnodes.

When `$vnodedef_additive` is `True`, MoM treats missing vnodes as if they are still present, and continues to report them as if they are present. This means that the server does not mark missing vnodes as stale.

When `$vnodedef_additive` is `False`, MoM does not list missing vnodes, the server’s information is brought up to date with the inventory and vnode definition files, and the server marks missing vnodes as stale.

Visible in configuration file on Cray only.

Format: `Boolean`

Default for MoM on Cray login node: `False`

**$wallmult <factor>**

Each job’s `walltime` usage is multiplied by this factor. For example:

```
$wallmult 1.5
```

### 3.2.1 Cray-only Initialization Values

**pbs_accounting_workload_mgmt <value>**

Controls whether CSA accounting is enabled. Name does not start with dollar sign.

If set to “1”, “on”, or “true”, CSA accounting is enabled. If set to “0”, “off”, or “false”, accounting is disabled.

Default: “true”; enabled.
3.2.2 SGI-only Initialization Values

cpuset_create_flags <flags>
Lists the flags for when MoM does a cpusetCreate(3) for each job. flags is an or-ed list of flags. The flags are:
Altix, supported versions of ProPack, Performance Suite
CPUSET_CPU_EXCLUSIVE|0
Default: CPUSET_CPU_EXCLUSIVE
ICE, supported versions of ProPack, Performance Suite
CPUSET_CPU_EXCLUSIVE|0
Default: 0

cpuset_destroy_delay <delay>
MoM will wait delay seconds before issuing a cpusetDestroy(3) on the cpuset of a just-completed job. This allows processes time to finish.
Example:
cpuset_destroy_delay 10
Format: Integer
Default for Altix: 0

memreserved <megabytes>
Deprecated. The amount of per-vnode memory reserved for system overhead. This much memory is deducted from the value of resources_available.mem for each vnode managed by this MoM.
For example,
memreserved 16
Default: 0MB

3.2.3 Static MoM Resources

Static resources local to the vnode are described one resource to a line, with a name and value separated by white space. For example, tape drives of different types could be specified by:
tape3480 4
tape3420 2
tapedat 1
tape8mm 1
Scheduler Parameters

This chapter lists the scheduler’s configuration parameters. These parameters are found in the scheduler’s configuration file, PBS_HOME/sched_priv/sched_config.

4.1 Format of Scheduler Configuration File

4.1.1 Parameters with Separate Primetime and Non-primetime Specification

If a scheduler parameter can be specified separately for primetime and non-primetime, the format for the parameter is the following:

{name: value [prime | non_prime | all | none]}

- The name field cannot contain any whitespace.
- The value field may contain whitespace if the string is double-quoted. value can be: True | False | <number> | <string>. “True” and “False” are not case-sensitive.
- The third field allows you to specify that the setting is to apply during primetime, non-primetime, all the time, or none of the time. A blank third field is equivalent to “all” which means that it applies to both prime- and non-primetime.

4.1.2 Parameters without Separate Primetime and Non-primetime Specification

If a scheduler parameter cannot be specified separately for primetime and non-primetime, the format for the parameter is the same as the above, except that there is no third field.
Chapter 4  Scheduler Parameters

4.1.3  Format Details

- Each entry must be a single, unbroken line.
- Entries must be quoted if they contain whitespace.
- Any line starting with a “#” is a comment, and is ignored.

4.1.4  Editing Configuration Files Under Windows

When you edit any PBS configuration file, make sure that you put a newline at the end of the file. The Notepad application does not automatically add a newline at the end of a file; you must explicitly add the newline.

4.2  Configuration Parameters

backfill
Toggle that controls whether PBS uses backfilling. If this is set to True, the scheduler attempts to schedule smaller jobs around higher-priority jobs when using strict_ordering, as long as running the smaller jobs won’t change the start time of the jobs they were scheduled around. The scheduler chooses jobs in the standard order, so other high-priority jobs will be considered first in the set to fit around the highest-priority job.

When this parameter is True, the scheduler backfills around starving jobs when help_starving_jobs is True.

Can be used with strict_ordering and help_starving_jobs

Format: Boolean
Default: True all

backfill_prime
The Scheduler will not run jobs which would overlap the boundary between prime-time and non-primetime. This assures that jobs restricted to running in either prime-time or non-primetime can start as soon as the time boundary happens.

See also prime_spill, prime_exempt_anytime_queues.

Format: Boolean
Default: False all

by_queue
If set to True, all jobs that can be run from the highest-priority queue are run, then any jobs that can be run from the next queue are run, and so on. Queues are ordered
Scheduler Parameters

highest-priority first. If `by_queue` is set to `False`, all jobs are treated as if they are in one large queue. The `by_queue` parameter is overridden by the `round_robin` parameter when `round_robin` is set to `True`.

See "Examining Jobs Queue by Queue" on page 136 in the PBS Professional Administrator’s Guide.

Format: Boolean
Default: `True`

`cpus_per_ssinode`

- **Deprecation**: Such configuration now occurs automatically.

`dedicated_prefix`

Queue names with this prefix are treated as dedicated queues, meaning jobs in that queue will only be considered for execution if the system is in dedicated time as specified in the configuration file `PBS_HOME/sched_priv/dedicated_time`.

See "Dedicated Time" on page 161 in the PBS Professional Administrator’s Guide.

Format: String
Default: `ded`

`fair_share`

Enables the fairshare algorithm, and turns on usage collecting. Jobs will be selected based on a function of their recent usage and priority (shares). Not a prime option.

See "Using Fairshare" on page 179 in the PBS Professional Administrator’s Guide.

Format: Boolean
Default: `False`

`fairshare_decay_factor`

Decay multiplier for fairshare usage reduction. Each decay period, the usage is multiplied by this value. Valid values: between 0 and 1, not inclusive. Not a prime option.

Format: Float
Default: 0.5

`fairshare_decay_time`

Time between fairshare usage decay operations. Not a prime option.

Format: Duration
Default: `24:00:00`
Chapter 4  Scheduler Parameters

fairshare_entity
  Specifies the entity for which fairshare usage data will be collected. Can be one of
  “euser”, “egroup”, “Account_Name”, “queue”, or “egroup:euser”. Not a
  prime option.
  Format: String
  Default: euser

fairshare_enforce_no_shares
  If this option is enabled, jobs whose entity has zero shares will never run. Requires
  fair_share to be enabled. Not a prime option.
  Format: Boolean
  Default: False

fairshare_usage_res
  Specifies the mathematical formula to use in fairshare calculations. Is composed of
  PBS resources as well as mathematical operators that are standard Python operators
  and/or those in the Python math module. When using a PBS resource, if
  resources_used.<resource> exists, that value is used. Otherwise, the value is taken
  from Resource_List.<resource>. Not a prime option.

  See "Tracking Resource Usage" on page 184 in the PBS Professional Administra-
  tor’s Guide.

  Format: String
  Default: cput

half_life
  Deprecated (in version 13.0).

  The half-life for fairshare usage; after the amount of time specified, the fairshare
  usage is halved. Requires that fair_share be enabled. Not a prime option.

  See "Using Fairshare" on page 179 in the PBS Professional Administrator’s Guide.

  Format: Duration
  Default: 24:00:00

help_starving_jobs
  Setting this option enables starving job support. Once jobs have waited for the
  amount of time given by max_starve they are considered starving. If a job is consid-
  ered starving, then no lower-priority jobs will run until the starving job can be run,
  unless backfilling is also specified. To use this option, the max_starve configuration
Scheduler Parameters

parameter needs to be set as well. See also backfill, max_starve, and the server’s eligible_time_enable attribute.

At each scheduler iteration, PBS calculates estimated.start_time and estimated.exec_vnode for starving jobs being backfilled around.

Format: Boolean
Default: True all

job_sort_key
Selects how jobs should be sorted. job_sort_key can be used to sort using either (a) resources or (b) special case sorting routines. Multiple job_sort_key entries can be used, one to a line, in which case the first entry will be the primary sort key, the second will be used to sort equivalent items from the first sort, etc. This attribute is overridden by the job_sort_formula attribute. If both are set, job_sort_key is ignored and an error message is printed.

Syntax:

job_sort_key: “PBS_resource HIGH|LOW”
job_sort_key: “fair_share_perc HIGH|LOW”
job_sort_key: “job_priority HIGH|LOW”

Options: One of the following is required.

HIGH
   Specifies descending sort.
LOW
Specifies ascending sort.

There are three special case sorting routines, which can be used instead of a specific PBS resource:

Table 4-1: Special Sorting in job_sort_key

<table>
<thead>
<tr>
<th>Special Sort</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fair_share_perc</td>
<td>Sort based on the values in the resource_group file. If user A has more priority than user B, all of user A’s jobs will always be run first. Past history is not used. This should only be used if entity share (strict priority) sorting is needed. <strong>Do not enable fair_share_perc sorting if using the fair_share scheduling option.</strong> (This option was previously named “fair_share” in the deprecated sort_by parameter). See “Sorting Jobs by Entity Shares (Was Strict Priority)” on page 168 in the PBS Professional Administrator’s Guide</td>
</tr>
<tr>
<td>HIGH</td>
<td></td>
</tr>
<tr>
<td>job_priority</td>
<td>Sort jobs by the job priority attribute regardless of job owner.</td>
</tr>
<tr>
<td>HIGH</td>
<td>LOW</td>
</tr>
<tr>
<td>sort_priority</td>
<td>Deprecated. See job_priority above.</td>
</tr>
<tr>
<td>HIGH</td>
<td>LOW</td>
</tr>
</tbody>
</table>

The following example shows how to sort jobs so that those with high CPU count come first:

```
job_sort_key: “ncpus HIGH” all
```

The following example shows how to sort jobs so that those with lower memory come first:

```
job_sort_key: “mem LOW” prime
```

Format: Quoted string
Default: Not in force

key
Deprecated. Use job_sort_key.
load_balancing
When set to True, the scheduler takes into account the load average on vnodes as well as the resources listed in the resources line in sched_config. Load balancing can result in overloaded CPUs.
Format: Boolean
Default: False all

load_balancing_rr
Deprecated. To duplicate this setting, enable load_balancing and set smp_cluster_dist to round_robin.

log_filter
Defines which event types to keep out of the scheduler’s logfile. The value should be set to the bitwise OR of the event classes which should be filtered. A value of 0 specifies maximum logging.
See "Specifying Scheduler Log Events" on page 1018 in the PBS Professional Administrator’s Guide.
Format: Integer
Default: 3328

max_starve
The amount of time before a job is considered starving. This variable is used only if help_starving_jobs is set.
Upper limit: None
Format: Duration
Default: 24:00:00

mem_per_ssinode
Deprecated. Such configuration now occurs automatically.

mom_resources
This option is used to query the MoMs to set the value of resources_available.RES where RES is a site-defined resource. Each MoM is queried with the resource name and the return value is used to replace
resources_available.RES on that vnode. On a multi-vnoded machine with a natural vnode, all vnodes will share anything set in mom_resources.

Format: String
Default: Unset

node_sort_key
Defines sorting on resource or priority values on vnodes. Resource must be numerical, for example, long or float. Up to 20 node_sort_key entries can be used, in which case the first entry will be the primary sort key, the second will be used to sort equivalent items from the first sort, etc.

Syntax:
node_sort_key: <resource>|sort_priority HIGH|LOW
node_sort_key: <resource> HIGH|LOW
    total|assigned|unused

    total
    Use the resources_available value. This is the default setting when sorting on a resource.

    assigned
    Use the resources_assigned value.

    unused
    Use the value given by resources_available - resources_assigned.

sort_priority
Sort vnodes by the value of the vnode priority attribute.

See "Sorting Vnodes on a Key" on page 300 in the PBS Professional Administrator’s Guide.

Format: String
Default: node_sort_key: sort_priority HIGH all

nonprimetime_prefix
Queue names which start with this prefix will be treated as non-primetime queues. Jobs within these queues will only run during non-primetime. Primetime and non-primetime are defined in the holidays file.

See "Using Primetime and Holidays" on page 256 in the PBS Professional Administrator’s Guide.

Format: String
Default: np_
Scheduler Parameters

peer_queue
Defines the mapping of a remote queue to a local queue for Peer Scheduling. Maximum number is 50 peer queues per scheduler.
See "Peer Scheduling" on page 218 in the PBS Professional Administrator’s Guide.
Format: String
Default: unset

preemptive_sched
Enables job preemption.
Format: String
Default: True all

preempt_checkpoint
Deprecated. Add “C” to preempt_order parameter.

preempt_fairshare
Deprecated. Add “fairshare” to preempt_prio parameter.

preempt_order
Defines the order of preemption methods which the Scheduler will use on jobs. This order can change depending on the percentage of time remaining on the job. The ordering can be any combination of S C and R:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>suspend</td>
</tr>
<tr>
<td>C</td>
<td>checkpoint</td>
</tr>
<tr>
<td>R</td>
<td>requeue</td>
</tr>
</tbody>
</table>

Table 4-2: Preemption Order Symbols

Usage: an ordering (SCR) optionally followed by a percentage of time remaining and another ordering. Must be a quoted list(“”).
Example:

preempt_order: “SR”
Chapter 4  

**Scheduler Parameters**

This example specifies that PBS should first attempt to use suspension to preempt a job, and if that is unsuccessful, then requeue the job.

Example:

```plaintext
preempt_order: “SCR 80 SC 50 S”
```

This example says if the job has between 100-81% of requested time remaining, first try to suspend the job, then try checkpoint then requeue. If the job has between 80-51% of requested time remaining, then attempt suspend then checkpoint; and between 50% and 0% time remaining just attempt to suspend the job.

Format: Quoted list

Default: `SCR`

**preempt_prio**

Specifies the ordering of priority for different preemption levels. Two or more job types may be combined at the same priority level with a plus sign ("+”) between them, using no whitespace. Comma-separated preemption levels are evaluated left to right, with higher priority to the left. The table below lists the six preemption levels. Note that any level not specified in the `preempt_prio` list is ignored.

**Table 4-3: Preemption Levels**

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>express_queue</td>
<td>Jobs in the express queues preempt other jobs. See <code>preempt_queue_prio</code>. Does not require <code>by_queue</code> to be <code>True</code>.</td>
</tr>
<tr>
<td>starving_jobs</td>
<td>When a job becomes starving it can preempt other jobs.</td>
</tr>
<tr>
<td>fairshare</td>
<td>When the entity owning a job exceeds its fairshare limit.</td>
</tr>
<tr>
<td>queue_softlimits</td>
<td>Jobs which are over their queue soft limits.</td>
</tr>
<tr>
<td>server_softlimits</td>
<td>Jobs which are over their server soft limits.</td>
</tr>
<tr>
<td>normal_jobs</td>
<td>The preemption level into which a job falls if it does not fit into any other specified level.</td>
</tr>
</tbody>
</table>

Example:

```plaintext
preempt_prio: “starving_jobs, normal_jobs, fairshare”
```
In this example, the first line states that starving jobs have the highest priority, then normal jobs, and jobs whose entities are over their fairshare limit are third highest.

Example:

preempt_prio: “normal_jobs, starving_jobs+fairshare”

This example shows that starving jobs whose entities are also over their fair-share limit are lower priority than normal jobs.

Format: Quoted list
Default: express_queue, normal_jobs

preempt_queue_prio

Specifies the minimum queue priority required for a queue to be classified as an express queue. Express queues do not require by_queue to be True.

Format: Integer
Default: 150

preempt_requeue

Deprecated. Add an “R” to preempt_order parameter.

preempt_sort

Whether jobs most eligible for preemption will be sorted according to their start times.

If set to “min_time_since_start”, first job preempted will be that with most recent start time.

If not set, preempted job will be that with longest running time.

Must be commented out in order to be unset; default scheduler configuration file has this parameter set to min_time_since_start.

Allowable values: “min_time_since_start”, or no preempt_sort setting.

See “Sorting Within Preemption Level” on page 250 in the PBS Professional Administrator’s Guide.

Format: String
Default: min_time_since_start

preempt_starving

Deprecated. Add “starving_jobs” to preempt_prio parameter.

preempt_suspend

Deprecated. Add an “S” to preempt_order parameter.
**primetime_prefix**
Queue names starting with this prefix are treated as primetime queues. Jobs will only run in these queues during primetime. Primetime and non-primetime are defined in the `holidays` file.
See "Using Primetime and Holidays" on page 256 in the PBS Professional Administrator’s Guide.
Format: String
Default: `p_`

**prime_exempt_anytime_queues**
Determines whether *anytime* queues are controlled by `backfill_prime`.
If set to *True*, jobs in an anytime queue will not be prevented from running across a primetime/non-primetime or non-primetime/primetime boundary.
If set to *False*, the jobs in an anytime queue may not cross this boundary, except for the amount specified by their `prime_spill` setting.
See also `backfill_prime`, `prime_spill`.
Format: Boolean.
Default: *False*

**prime_spill**
Specifies the amount of time a job can spill over from non-primetime into primetime or from primetime into non-primetime. This option can be separately specified for prime- and non-primetime. This option is only meaningful if `backfill_prime` is *True*.
See also `backfill_prime`, `prime_exempt_anytime_queues`.
For example, the first setting below means that non-primetime jobs can spill into primetime by 1 hour. However the second setting means that jobs in either prime/non-prime can spill into the other by 1 hour.
```plaintext
prime_spill: 1:00:00 prime
prime_spill: 1:00:00 all
```
Format: Duration
Default: `00:00:00`

**provision_policy**
Specifies how vnodes are selected for provisioning. Can be set by Manager only; readable by all. Can be set to one of the following:

- **avoid_provision**
  PBS first tries to satisfy the job's request from free vnodes that already have the requested AOE instantiated. PBS uses `node_sort_key` to sort these vnodes.
If it cannot satisfy the job's request using vnodes that already have the requested AOE instantiated, it does the following:

PBS uses the server's node_sort_key to select the free vnodes that must be provisioned in order to run the job, choosing from any free vnodes, regardless of which AOE is instantiated on them.

Of the selected vnodes, PBS provisions any that do not have the requested AOE instantiated on them.

**aggressive_provision**

PBS selects vnodes to be provisioned without considering which AOE is currently instantiated.

PBS uses the server's node_sort_key to select the vnodes on which to run the job, choosing from any free vnodes, regardless of which AOE is instantiated on them. Of the selected vnodes, PBS provisions any that do not have the requested AOE instantiated on them.

Format: String

Default: *aggressive_provision*

**resources**

Specifies those resources which are not to be over-allocated when scheduling jobs. Vnode-level boolean resources are automatically honored and do not need to be listed here. Limits are set by setting `resources_available.resourceName` on vnodes, queues, and the server. The Scheduler will consider numeric (integer or float) items as consumable resources and ensure that no more are assigned than are available (e.g. `ncpus` or `mem`). Any string resources will be compared using string comparisons. If “host” is not added to the resources line, then when the user submits a job requesting a specific vnode in the following syntax:

```
qsub -l select=host=vnodeName
```

the job will run on any host.

Format: String.

Default: `ncpus, mem, arch, host, vnode, aoe, netwins`

**resource_unset_infinite**

Resources in this list are treated as infinite if they are unset. Cannot be set differently for primetime and non-primetime.

Example:

```
resource_unset_infinite: “vmem, foo_licenses”
```

Format: Comma-delimited list of resources

Default: Empty list
Chapter 4  

Scheduler Parameters

round_robin
If set to True, the scheduler will consider one job from the first queue, then one job from the second queue, and so on in a circular fashion. The queues are ordered with the highest priority queue first. Each scheduling cycle starts with the same highest-priority queue, which will therefore get preferential treatment.

If there are groups of queues with the same priority, and this parameter is set to True, the scheduler round-robins through each group of queues before moving to the next group.

If round_robin is set to False, the scheduler will consider jobs according to the setting of the by_queue parameter.

When True, overrides the by_queue parameter.

Format: Boolean

Default: False

server_dyn_res
Directs the Scheduler to replace the server’s resources_available values with new values returned by a site-specific external program.

See "Dynamic Server-level Resources" on page 358 in the PBS Professional Administrator’s Guide for details of usage.

Format: String

Default: Unset.

smp_cluster_dist
Deprecated (12.2). Specifies how single-host jobs should be distributed to all hosts of the complex.

Options:

pack
Keep putting jobs onto one host until it is full and then move on to the next.

round_robin
Put one job on each vnode in turn before cycling back to the first one.

lowest_load
Put the job on the lowest-loaded host.

Format: String

Default: pack all
sort_by

Deprecated. Use job_sort_key.

sort_queues

Deprecated (12.2). If set to True queues are sorted so that the highest priority queues are considered first. Queues are sorted by each queue’s priority attribute. The queues are sorted in a descending fashion, that is, a queue with priority 6 comes before a queue with priority 3.

When set to False, queues are not sorted.

This is a prime option, which means it can be selectively applied to primetime or non-primetime.

Note that the sorted order of queues is not taken into consideration unless by_queue is set to True.

See "Sorting Queues into Priority Order" on page 295 in the PBS Professional Administrator’s Guide.

Format: Boolean

Default: True ALL

strict_fifo

Deprecated. Use strict_ordering.

strict_ordering

Specifies that jobs must be run in the order determined by whatever sorting parameters are being used. This means that a job cannot be skipped due to resources required not being available. If a job due to run next cannot run, no job will run, unless backfilling is used, in which case jobs can be backfilled around the job that is due to run next.

See "FIFO with Strict Ordering" on page 193 in the PBS Professional Administrator’s Guide.

Example line in PBS_HOME/sched_priv/sched_config:

strict_ordering: True ALL

Format: Boolean.

Default: False all

sync_time

Deprecated. The amount of time between writing the fairshare usage data to disk.

Requires fair_share to be enabled.

Format: Duration

Default: 1:00:00
unknown_shares

The number of shares for the unknown group. These shares determine the portion of a resource to be allotted to that group via fairshare. Requires fair_share to be enabled.

See "Using Fairshare" on page 179 in the PBS Professional Administrator’s Guide.

Format: Integer

Default: The unknown group gets 0 shares unless set.
5 Resources

This chapter describes the resources provided by PBS Professional.

5.1 Resource Data Types

Data types for built-in and custom resource are described in section 7.1, “List of Formats”, on page 421.

5.2 Advice on Using Resources

Resource names are case-insensitive.

The following advice will help you use resources.

5.2.1 Using boolean Resources

See "Boolean" on page 421.

Non-consumable.

5.2.2 Using duration Resources

See "Duration" on page 423.

Specifies a maximum time period the resource can be used.

Non-consumable.

5.2.3 Using float Resources

See "Float" on page 423.

Consumable.
5.2.4 Using long Resources

See "long" on page 426.

Consumable.

5.2.5 Using size Resources

See "Size" on page 427.

Consumable.

5.2.6 Using string Resources

See "String (resource value)" on page 427.

Non-consumable.

We do not recommend using non-printing characters.

When using qsub -l <string resource>=<string value>, you must escape string values for both qsub and the shell. Example:

```bash
qsub -l teststring='"abc def"
```

The final quote should be single, not double.

Values are case-sensitive.

5.2.7 Using string_array Resources

See "string_array" on page 427.

Non-consumable. Resource request will succeed if request matches one of the values. Resource request can contain only one string.

A string array resource with one value works exactly like a string resource.

The value of resources_default.<string array resource> can only be one string.

5.3 Custom Resource Formats

The names of custom numeric resources must be alphanumeric with a leading alphabetic: [a-zA-Z][a-zA-Z0-9_]*. Allowable values for float and long resources are the same as for built-in resources. Custom boolean, time, size, string or string array resources must have the same format as built-in resources.
5.4 Built-in Resources

Different resources are available on different systems, often depending on the architecture of the computer itself. The table below lists the available resources that can be requested by PBS jobs on any system.

Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accelerator</td>
<td>Indicates whether this vnode is associated with an accelerator. Host-level. Can be requested only inside of a select statement. On Cray, this resource exists only when there is at least one associated accelerator. On Cray, this is set to <code>True</code> when there is at least one associated accelerator whose state is <code>UP</code>. On Cray, set to <code>False</code> when all associated accelerators are in state <code>DOWN</code>. Used for requesting accelerators. Format: Boolean. Python type: bool</td>
</tr>
</tbody>
</table>
| accelerator_memory | Indicates amount of memory for accelerator(s) associated with this vnode. Host-level. Can be requested only inside of a select statement. On Cray, PBS sets this resource only on vnodes with at least one accelerator with state = `UP`. For Cray, PBS sets this resource on the 0th NUMA node (the vnode with `PBScray-seg=0`), and the resource is shared by other vnodes on the compute node.

For example, on vnodeA_2_0:

```
resources_available.accelerator_memory=4196mb
```

On vnodeA_2_1:

```
resources_available.accelerator_memory=@vnodeA_2_0
```

Consumable. Format: size. Python type: pbs.size |
| accelerator_model | Indicates model of the accelerator(s) associated with this vnode. Host-level. On Cray, PBS sets this resource only on vnodes with at least one accelerator with state = `UP`. Can be requested only inside of a select statement. Non-consumable. Format: String. Python type: str |
## Resources

### Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aoe</td>
<td>List of AOE (Application Operating Environments) that can be instantiated on a vnode. Case-sensitive. An AOE is the environment that results from provisioning a vnode. Each job can request at most one AOE. Cannot be set on server's host. Allowable values are site-dependent. Settable by Manager and Operator; visible to all. Non-consumable. Type: string array. Python type: str</td>
</tr>
<tr>
<td>arch</td>
<td>System architecture. One architecture can be defined for a vnode. One architecture can be requested per vnode. Allowable values and effect on job placement are site-dependent. Can be requested only inside of a select statement. Non-consumable. Type: string. Python type: str</td>
</tr>
<tr>
<td>cput</td>
<td>Amount of CPU time used by the job for all processes on all vnodes. Establishes a job resource limit. Can be requested only outside of a select statement. Non-consumable. Type: duration. Python type: pbs.duration</td>
</tr>
<tr>
<td>exec_vnode</td>
<td>Read-only. The vnodes that PBS estimates this job will use. Cannot be requested for a job; used for reporting only. Type: string. Python type: str</td>
</tr>
<tr>
<td>file</td>
<td>Size of any single file that may be created by the job. Can be requested only outside of a select statement. Type: size. Python type: pbs.size</td>
</tr>
<tr>
<td>host</td>
<td>Name of execution host. Can be requested only inside of a select statement. Automatically set to the short form of the hostname in the Mom attribute. On Cray compute node, set to <code>&lt;mpp_host&gt;_&lt;nid&gt;</code>. On CLE 2.2, value is set to &quot;default&quot;. Cannot be changed. Site-dependent. Type: string. Python type: str</td>
</tr>
</tbody>
</table>
### Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_walltime</td>
<td>Maximum walltime allowed for a shrink-to-fit job. Job’s actual walltime is between max_walltime and min_walltime. PBS sets walltime for a shrink-to-fit job. If this resource is specified, min_walltime must also be specified. Must be greater than or equal to min_walltime. Cannot be used for resources_min or resources_max. Cannot be set on job arrays or reservations. If not specified, PBS uses 5 years as the maximum time slot. Can be requested only outside of a select statement. Non-consumable. Default: None. Type: duration. Python type: pbs.duration</td>
</tr>
<tr>
<td>mem</td>
<td>Amount of physical memory i.e. workingset allocated to the job, either job-wide or vnode-level. Can be requested only inside of a select statement. Consumable. Type: size. Python type: pbs.size</td>
</tr>
<tr>
<td>min_walltime</td>
<td>Minimum walltime allowed for a shrink-to-fit job. When this resource is specified, job is a shrink-to-fit job. If this attribute is set, PBS sets the job’s walltime. Job’s actual walltime is between max_walltime and min_walltime. Must be less than or equal to max_walltime. Cannot be used for resources_min or resources_max. Cannot be set on job arrays or reservations. Can be requested only outside of a select statement. Non-consumable. Default: None. Type: duration. Python type: pbs.duration</td>
</tr>
<tr>
<td>mpiprocs</td>
<td>Number of MPI processes for this chunk. Defaults to 1 if ncpus &gt; 0, 0 otherwise. Can be requested only inside of a select statement. Cannot use sum from chunks as job-wide limit. Type: integer. Python type: int</td>
</tr>
<tr>
<td></td>
<td>The number of lines in PBS_NODEFILE is the sum of the values of mpiprocs for all chunks requested by the job. For each chunk with mpiprocs=P, the host name for that chunk is written to the PBS_NODEFILE P times.</td>
</tr>
<tr>
<td>mpparch</td>
<td>Deprecated. MPP compute node system type. Can be requested only outside of a select statement. Allowable values: XT or X2. Cray-only resource. Ignored at other systems. Type: string. Python type: str</td>
</tr>
</tbody>
</table>
### Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mppdepth</td>
<td><strong>Deprecated.</strong> Depth (number of threads) of each processor. Specifies the number of processors that each processing element will use. Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Default: 1. Type: integer. Python type: int</td>
</tr>
<tr>
<td>mpphost</td>
<td><strong>Deprecated.</strong> MPP host. Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Type: string. Python type: str</td>
</tr>
</tbody>
</table>
| mpplabels | **Deprecated.** List of node labels. Runs the application only on those nodes with the specified labels. Format: comma-separated list of labels and/or a range of labels. Any lists containing commas should be enclosed in quotes escaped by backslashes. For example: 

```bash
#PBS -l mpplabels="red,blue"
```

or

```bash
qsub -l mpplabels="red,blue"
```

Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Type: string. Python type: str, one of “soft” or “hard” |
| mppmem | **Deprecated.** The maximum memory for all applications. The per-processing-element maximum resident set size memory limit. Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Type: size. Python type: pbs.size |
### Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
</table>
| mppnodes | **Deprecated.** Manual placement list consisting of a comma-separated list of nodes (node1,node2), a range of nodes (node1-node2), or a combination of both formats. Node values are expressed as decimal numbers. The first number in a range must be less than the second number (i.e., 8-6 is invalid). A complete node list is required. Any lists containing commas should be enclosed in quotes escaped by backslashes. For example:  

```
#PBS -l mppnodes="40-48,52-60,84,86,88,90"
```
or

```
qsub -l mppnodes="40-48,52-60,84,86,88,90"
```

Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Type: string. Python type: str |
| mppnpnn | **Deprecated.** Number of processing elements (PEs) per node. Can be requested only outside of a select statement. Cray-only resource.Ignored at other systems. Type: integer. Python type: int |
| mppwidth | **Deprecated.** Number of processing elements (PEs) for the job. Can be requested only outside of a select statement. Cray-only resource. Ignored at other systems. Type: integer. Python type: int |
## Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
</table>
| naccelerators | Indicates number of accelerators on the host. Host-level. On Cray, PBS sets this resource only on vnodes whose hosts have at least one accelerator with state = UP. PBS sets this resource to the number of accelerators with state = UP. For Cray, PBS sets this resource on the 0th NUMA node (the vnode with PBScray-seg=0), and the resource is shared by other vnodes on the compute node. For example, on vnodeA_2_0:  
\[
\text{resources\_available.naccelerators}=1
\]  
On vnodeA_2_1:  
\[
\text{resources\_available.naccelerators}=@\text{vnodeA}_2_0
\]  
Can be requested only inside of a select statement. Consumable. Format: long. Python type: int |
| nchunk | This is the number of chunks requested between plus symbols in a select statement. For example, if the select statement is  
\[
\text{select 4:ncpus}=2+12:ncpus=8
\], the value of nchunk for the first part is 4, and for the second part it is 12. The nchunk resource cannot be named in a select statement; it can only be specified by placing a number before the colon, as in the above example. When the number is omitted, nchunk is 1. Non-consumable. This resource can be used to specify the default number of chunks at the server or queue (replacing mpp-width.)  
Example: set queue myqueue  
\[
\text{default\_chunk.nchunk}=2
\]  
Settable by Manager and Operator; readable by all. This resource cannot be used in server and queue resources_min and resources_max. Format: Integer. Python type: int. Default value: 1 |
<p>| ncpus | Number of processors requested. Cannot be shared across vnodes. Can be requested only inside of a select statement. Consumable. Type: integer. Python type: int |</p>
<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>netwins</td>
<td>Number of network windows on a high performance switch. Can be requested only inside of a select statement. Read-only. Type: integer. Python type: int</td>
</tr>
<tr>
<td>nice</td>
<td>Nice value under which the job is to be run. Host-dependent. Can be requested only outside of a select statement. Type: integer. Python type: int</td>
</tr>
<tr>
<td>nodect</td>
<td>Deprecated. Number of chunks in resource request from selection directive, or number of hosts requested from node specification. Otherwise defaults to value of 1. Can be requested only outside of a select statement. Read-only. Type: integer. Python type: int</td>
</tr>
<tr>
<td>nodes</td>
<td>Deprecated. Number of hosts requested. Integer.</td>
</tr>
<tr>
<td>ompthreads</td>
<td>Number of OpenMP threads for this chunk. Defaults to ncpus if not specified. Can be requested only inside of a select statement. Non-consumable. Cannot use sum from chunks as job-wide limit. Type: integer. Python type: int For the MPI process with rank 0, the environment variables NCPUS and OMP_NUM_THREADS are set to the value of ompthreads. For other MPI processes, behavior is dependent on MPI implementation.</td>
</tr>
<tr>
<td>pcput</td>
<td>Amount of CPU time allocated to any single process in the job. Establishes a job resource limit. Non-consumable. Can be requested only outside of a select statement. Type: duration. Python type: pbs.duration</td>
</tr>
<tr>
<td>pmem</td>
<td>Amount of physical memory (workingset) for use by any single process of the job. Establishes a job resource limit. Can be requested only outside of a select statement. Non-consumable. Type: size. Python type: pbs.size</td>
</tr>
</tbody>
</table>
## Table 5-1: Built-in Resources

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preempt_targets</td>
<td>List of resources and/or queues. Jobs requesting those resources or in those queues are preemption targets. Syntax: <code>&lt;Resource_List.&lt;resource&gt;=&lt;value&gt; and/or queue=&lt;queue name&gt;&gt;</code>. You can list multiple comma-separated targets. Non-consumable. Can be requested only outside of a select statement. Type: string_array</td>
</tr>
<tr>
<td>pvmem</td>
<td>Amount of virtual memory for use by the job. Establishes a job resource limit. Can be requested only outside of a select statement. Not consumable. Type: size. Python type: pbs.size</td>
</tr>
<tr>
<td>site</td>
<td>Arbitrary string resource. Can be requested only outside of a select statement. Not consumable. Type: string. Python type: str</td>
</tr>
<tr>
<td>software</td>
<td>Site-specific software specification. Can be requested only outside of a select statement. Allowable values and effect on job placement are site-dependent. Type: string. Python type: pbs.software</td>
</tr>
<tr>
<td>start_time</td>
<td>Read-only. The estimated start time for this job. Cannot be requested for a job; used for reporting only. Type: long. Python type: int</td>
</tr>
<tr>
<td>vmem</td>
<td>Amount of virtual memory for use by all concurrent processes in the job. Establishes a per-chunk limit. Can be requested only inside of a select statement. Consumable. Type: size. Python type: pbs.size</td>
</tr>
<tr>
<td>vnode</td>
<td>Name of virtual node (vnode) on which to execute. For use inside chunks only. Site-dependent. Can be requested only inside of a select statement. Type: string. Python type: str</td>
</tr>
</tbody>
</table>

See the `pbs_node_attributes(7B)` man page.
5.5 Custom Cray Resources

PBS provides custom resources specifically created for the Cray. They are listed in the following table:

Table 5-2: Custom Cray Resources

<table>
<thead>
<tr>
<th>Resource Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBScrayhost</td>
<td>On CLE 2.2, this is set to “default”. On CLE 3.0 and higher, used to delineate a Cray system, containing ALPS, login nodes running PBS MoMs, and compute nodes, from a separate Cray system with a separate ALPS. Non-consumable. The value of PBScrayhost is set to the value of mpp_host for this system. Format: String. Default: CLE 2.2: “default”; CLE 3.0 and higher: None</td>
</tr>
</tbody>
</table>
### Table 5-2: Custom Cray Resources

<table>
<thead>
<tr>
<th>Resource Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBScraylabel_&lt;label name&gt;</td>
<td>Tracks labels applied to compute nodes. For each label on a compute node, PBS creates a custom resource whose name is a concatenation of <code>PBScraylabel_</code> and the name of the label. PBS sets the value of the resource to <code>True</code> on all vnodes representing the compute node. Name format: <code>PBScraylabel_&lt;label name&gt;</code> For example, if the label name is <code>Blue</code>, the name of this resource is <code>PBScraylabel_Blue</code>. Format: Boolean. Default: None</td>
</tr>
<tr>
<td>PBScraynid</td>
<td>Used to track the node ID of the associated compute node. All vnodes representing a particular compute node share a value for <code>PBScraynid</code>. Non-consumable. The value of <code>PBScraynid</code> is set to the value of <code>node_id</code> for this compute node. Non-consumable. Format: String. Default: None</td>
</tr>
<tr>
<td>PBScrayorder</td>
<td>Used to track the order in which compute nodes are listed in the Cray inventory. All vnodes associated with a particular compute node share a value for <code>PBScrayorder</code>. Non-consumable. Vnodes for the first compute node listed are assigned a value of 1 for <code>PBScrayorder</code>. The vnodes for each subsequent compute node listed are assigned a value one greater than the previous value. Do not use this resource in a resource request. Format: Integer. Default: None</td>
</tr>
<tr>
<td>PBScrayseg</td>
<td>Tracks the segment ordinal of the associated NUMA node. For the first NUMA node of a compute host, the segment ordinal is 0, and the value of <code>PBScrayseg</code> for the associated vnode is 0. For the second NUMA node, the segment ordinal is 1, <code>PBScrayseg</code> is 1, and so on. Non-consumable. Format: String. Default: None</td>
</tr>
</tbody>
</table>
5.6 Specifying Architectures

The `resources_available.arch` resource is the value reported by MoM unless explicitly set by the Administrator. The values for `arch` are:

**Table 5-3: Values for resources_available.arch**

<table>
<thead>
<tr>
<th>OS</th>
<th>Resource Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>AIX 5</td>
<td>aix4</td>
</tr>
<tr>

</tbody>
</table>
This chapter lists all of the PBS attributes. Attributes are listed by the PBS object they modify. For example, all attributes of jobs are listed in section 6.1, “Job Attributes”, on page 393. Attributes are case-sensitive.

6.1 When Attribute Changes Take Effect

When you set the value of most attributes, the change takes place immediately. You do not need to restart any daemons in order to make the change.

6.2 How To Set Attributes

Most attributes are set using the \texttt{qmgr} command. However, some vnode attributes must be set using the \texttt{pbs_mom -s insert} command, to create a Version 2 configuration file. For information about these requirements, see "Choosing Configuration Method" on page 52 in the PBS Professional Administrator’s Guide. The following are the instructions for setting all other attributes.

To set the value of a non-string_array attribute, use the \texttt{qmgr} command, either from the command line or within \texttt{qmgr}:

\begin{verbatim}
qmgr -c 'set <object> <attribute> = <value>'
Qmgr: set <object> <attribute> = <value>
\end{verbatim}
Chapter 6  Attributes

To set or change the value of a string_array attribute, use the qmgr command, either from the command line or within qmgr:

```
qmgr -c 'set <object> <attribute> = <value>'
qmgr -c 'set <object> <attribute> = "<value,value>"'
qmgr -c 'set <object> <attribute> += <value>'
qmgr -c 'set <object> <attribute> -= <value>'
```

Example:
```
Qmgr: set server resources_max.walltime = 24:00:00
```

To unset the value of an attribute:

```
qmgr -c 'unset <object> <attribute>'
```

where `<object>` is one of server, queue, hook, node, or sched.

For example, to set `resources_max.walltime` at the server to be 24 hours:

```
Qmgr: set server resources_max.walltime = 24:00:00
```

See “qmgr” on page 158.
6.3 **Viewing Attribute Values**

If you want to view attribute values, the following commands are helpful:

- **qstat**: see section 2.58, “qstat”, on page 210
- **qmgr**: see section 2.48, “qmgr”, on page 158
- **pbs_rstat**: see section 2.28, “pbs_rstat”, on page 81

- To see server attributes, use one of the following:
  - `qstat -B -f`
  - **Qmgr**: list server
- To see queue attributes, use one of the following:
  - `qstat -Q -f <queue name>`
  - **Qmgr**: list queue <queue name>
- To see job attributes:
  - `qstat -f <job ID>`
- To see hook attributes:
  - **Qmgr**: list hook <hook name>
- To see scheduler attributes:
  - **Qmgr**: list sched
- To see vnode attributes:
  - **Qmgr**: list node <node name>
- To see reservation attributes:
  - **Qmgr**: pbs_rstat -F
6.4 

Attribute Table Format

In the following tables, the columns contain the following information:

- **Name**: The name of the attribute
- **Description**: A description of the attribute’s function
- **Format**: The attribute’s format
- **Val/ Opt**: If the attribute can take only specific values or options, each is listed here
- **Value/Option Description**: If the attribute can take only specific values or options, the behavior of each value or option is described here
- **Default Value, Def Val**: The attribute’s default value, if any
- **Python Type**: The attribute’s Python attribute value type
Attributes

User, Oper, Mgr
Indicates the actions allowed for unprivileged users, Operators, and Managers
The following table shows the operations allowed and their symbols:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Entity can read attribute</td>
</tr>
<tr>
<td>w</td>
<td>Entity can directly set or alter attribute</td>
</tr>
<tr>
<td>s</td>
<td>Entity can set but not alter attribute</td>
</tr>
<tr>
<td>a</td>
<td>Entity can alter but not set attribute</td>
</tr>
<tr>
<td>i</td>
<td>Entity can indirectly set attribute</td>
</tr>
<tr>
<td>-</td>
<td>Entity cannot set or alter attribute, whether directly or indirectly</td>
</tr>
</tbody>
</table>

6.5 Caveats

- The Python types listed as Python dictionaries support a restricted set of operations. They can reference values by index. Other features, such as `has_key()`, are not available.
- Do not use `qmgr` to set attributes for reservation queues.
6.6 Server Attributes

Server attributes are divided into these groups:

- Those that can be set by an operator or manager
- Those that are read-only

<table>
<thead>

<td>Specifies whether the server obeys the group reservation access control list in the acl_resv_groups server attribute.</td>
<td>Boolean</td>
<td></td>
<td>When this attribute is True, the server limits group access according to the access control list.</td>
<td>False; all groups allowed access</td>
<td>bool</td>
<td>r</td>
<td>r</td>
<td>w</td>
</tr>
</tbody>
</table>
## Attributes

### acl_resv_groups

List of groups allowed or denied permission to create reservations in this PBS complex. The groups in the list are groups on the server host, not submission hosts. List is evaluated left-to-right; first match in list is used.

<table>
<thead>
<tr>
<th>Format</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String. Form: [+]group_name[,...]</td>
<td></td>
<td></td>
<td>pbs.acl</td>
</tr>
</tbody>
</table>

### acl_resv_host_enable

Specifies whether the server obeys the host reservation access control list in the acl_resv_hosts server attribute.

<table>
<thead>
<tr>
<th>Type</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>When this attribute is True, the server limits host access according to the access control list.</td>
<td>False; access allowed from all hosts</td>
<td>bool</td>
</tr>
</tbody>
</table>

### acl_resv_hosts

List of hosts from which reservations can be created in this PBS complex. This list is made up of the fully-qualified domain names of the hosts. List is evaluated left-to-right; first match in list is used.

<table>
<thead>
<tr>
<th>Format</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String. Form: [+]host-name.domain[,...]</td>
<td></td>
<td>None; access allowed from all hosts</td>
<td>pbs.acl</td>
</tr>
</tbody>
</table>

### acl_resv_user_enable

Specifies whether the server limits which users are allowed to create reservations, according to the access control list in the acl_resv_users server attribute.

<table>
<thead>
<tr>
<th>Type</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>When this attribute is True, the server limits user reservation creation according to the access control list.</td>
<td>False; all users are allowed to create reservations</td>
<td>bool</td>
</tr>
</tbody>
</table>

### acl_resv_users

List of users allowed or denied permission to create reservations in this PBS complex. List is evaluated left-to-right; first match in list is used.

<table>
<thead>
<tr>
<th>Format</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String. Form: [+]user[@host][,...]</td>
<td></td>
<td>None</td>
<td>pbs.acl</td>
</tr>
</tbody>
</table>
### Attributes

### Attributes

**Chapter 6**

#### Flattuid

*Description:* Used for authorization allowing users to submit and alter jobs. Specifies whether user names are treated as being the same across the PBS server and all submission hosts in the PBS complex. Can be used to allow users without accounts at the server host to submit jobs.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Format</th>
<th>Val / Opt</th>

<tr>
<td>flatuid</td>
<td>Used for authorization allowing users to submit and alter jobs. Specifies whether user names are treated as being the same across the PBS server and all submission hosts in the PBS complex. Can be used to allow users without accounts at the server host to submit jobs.</td>
<td>Boolean</td>
<td>True</td>
<td>PBS assumes that UserA@&lt;submithost&gt; is the same user as UserA@&lt;server&gt;. Jobs that run under the name of the job owner do not need authorization. A job submitted under a different username, by using the u option to the qsub command, requires authorization. Entries in .rhosts or hosts.equiv are not checked, so even if UserA@host1 has an entry for UserB@host2, UserB@host2 cannot operate on UserA@host1’s jobs. User without account on server can submit jobs.</td>
<td>False; authorization is required</td>
<td>bool</td>
<td>r</td>
<td>r</td>
<td>r</td>

<td>r,</td>
<td>r,</td>
</tr>
</tbody>
</table>
### Attributes

**job_sort_formula**

Formula for computing job priorities. Described in the *PBS Professional Administrator's Guide*. If the attribute `job_sort_formula` is set, the scheduler will use the formula in it to compute job priorities. If it is unset, the scheduler computes job priorities according to fairshare, if fairshare is enabled. If neither is defined, the scheduler uses `job_sort_key`. When the scheduler sorts jobs according to the formula, it computes a priority for each job, where that priority is the value produced by the formula. Jobs with a higher value get higher priority. The formula can be made up of expressions, where expressions contain terms which are added, subtracted, multiplied, or divided, and which can contain parentheses, exponents, unary plus and minus, the ternary operator, and Python math module functions.

**log_events**

Specifies the types of events which are logged.

### Attributes

**max_user_run_soft**
- **Description:** Old limit attribute. Incompatible with new limit attributes. The soft limit on the number of jobs owned by a single user that are allowed to be running within this complex at one time. If a user has more than this number of jobs running, their jobs are eligible to be preempted by jobs from users who are not over their soft limit.
- **Format:** Integer
- **Value/Option Description:** None
- **Default Value:** None
- **Python Type:** int
- **User Op:** r, r, r, w, w

**node_fail_requeue**
- **Description:** Controls whether running jobs are automatically requeued or are deleted when the primary execution vnode fails. Number of seconds to wait after losing contact with Mother Superior before requeueing or deleting jobs. Reverts to default value when server is restarted.
- **Format:** Integer
- **Value/Option Description:** Unset, zero, less than zero, Greater than zero
- **Default Value:** 310
- **Python Type:** int
- **User Op:** r, r, r, w, w

**node_group_enable**
- **Description:** Specifies whether placement sets (which includes node grouping) are enabled. See `node_group_key` server attribute.
- **Format:** Boolean
- **Value/Option Description:** When set to True, placement sets are enabled.
- **Default Value:** False
- **Python Type:** bool
- **User Op:** r, r, r, w, w

### Attributes

**Mail_Users**  
The set of users to whom mail is sent for the reservation events specified in the Mail_Points attribute. See the M mail_list option to the pbs_sub command.

**Priority**  
No longer used.

**Reserve_count**  
The count of occurrences in the standing reservation.

**Reserve_duration**  
Reservation duration in seconds. For a standing reservation, this is the duration for one occurrence.

**Reserve_end**  
The date and time when an advance reservation or the soonest occurrence of a standing reservation ends.

| reserve_rule | The rule that describes the recurrence pattern of a standing reservation. See the r option to the pbs_rsub command. | Either of two forms:  
  "FREQ= freq_spec; COUNT= count_spec; interval_spec"  
  or  
  "FREQ= freq_spec; UNTIL= until_spec; interval_spec" | freq_spec | Frequency with which the standing reservation repeats. Valid values are: WEEKLY|DAILY|HOURLY | None | str | r, s, r, w, w |
| count_spec | The exact number of occurrences. Number up to 4 digits in length. Format: integer. | count_spec | None | | | |
| interval_spec | Specifies interval. Format is one or both of:  
  BYDAY = MO|TU|WE|TH|FR|SA|SU or BYHOUR = 0|1|2|...|23 | None |
| until_spec | Occurrences will start up to but not after date and time specified. Format: YYYY-MM-DD[THHMMSS]  
  Year-month-day part and hour-minute-second part separated by a capital T. | None | | | | |

6.9 Queue Attributes

Queue attributes are divided into the following groups:

- Those that apply to both execution and routing queues
- Those that apply only to execution queues
- Those that apply only to routing queues

In the following table, Q Type indicates the type of queue to which the attribute applies: R (routing), E (execution):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Format</th>
<th>Q Type</th>
<th>Val / Opt</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
<th>User</th>
<th>Oper</th>
<th>Mgr</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_group_enable</td>
<td>Controls whether the queue obeys the access control list defined in the acl_groups queue attribute.</td>
<td>Boolean</td>
<td>R, E</td>
<td></td>
<td>When set to True, the queue limits group access according to the access control list.</td>
<td>False; all groups allowed access</td>
<td>bool</td>
<td>r</td>
<td>r</td>
<td>w</td>
</tr>
<tr>
<td>acl_groups</td>
<td>List of groups which are allowed or denied access to this queue. The groups in the list are groups on the server host, not submitting hosts. List is evaluated left-to-right; first match in list is used.</td>
<td>String. Form: [+</td>
<td>-] group-name[,...]</td>
<td>R, E</td>
<td></td>
<td>None</td>
<td>pbs.acl</td>
<td>r</td>
<td>r</td>
<td>w</td>
</tr>
<tr>
<td>acl_host_enable</td>
<td>Controls whether the queue obeys the access control list defined in the acl_hosts queue attribute.</td>
<td>Boolean</td>
<td>R, E</td>
<td></td>
<td>When set to True, the queue limits host access according to the access control list.</td>
<td>False; all hosts allowed access</td>
<td>bool</td>
<td>r</td>
<td>r</td>
<td>w</td>

**Chapter 6**

**Attributes**

**Queue Attributes**

- **resources_max**: The maximum amount of each resource which can be requested by a single job in this queue. The queue value supersedes any server wide maximum limit.
  - Format: `String. Form: resources_max.<resource_name>=<value>, resources_max.<resource_name>=<value>, ...`
  - Q Type: R, E
  - Val / Opt: None
  - Value/Option Description: None; infinite usage
  - Default Value: Dictionary: `resources_max[<resource name>=<value>]=<value>` where `<resource name>` is any built-in or custom resource
  - Python Type: Dictionary
  - User Access: r
  - Operator Access: r, w, w

- **resources_min**: The minimum amount of each resource that can be requested by a single job in this queue.
  - Format: `String. Form: resources_min.<resource_name>=<value>, resources_min.<resource_name>=<value>, ...`
  - Q Type: R, E
  - Val / Opt: Zero
  - Value/Option Description: None
  - Default Value: Dictionary: `resources_min[<resource name>=<value>]=<value>` where `<resource name>` is any built-in or custom resource
  - Python Type: Dictionary
  - User Access: r
  - Operator Access: r, w, w

- **started**: Specifies whether jobs in this queue can be scheduled for execution.
  - Format: `Boolean`
  - Q Type: R, E
  - Val / Opt: Set to True: jobs in this queue can run
  - Value/Option Description: False
  - Default Value: bool
  - Python Type: bool
  - User Access: r
  - Operator Access: r, r, r, w

- **state_count**: The number of jobs in each state currently residing in this queue.
  - Format: `String. Form: transit-ing=<val>, exit-ing=<val>, ...`
  - Q Type: R, E
  - Val / Opt: None
  - Value/Option Description: None
  - Default Value: pbs.state_count
  - Python Type: pbs.state_count
  - User Access: r
  - Operator Access: r, r, r

- **total_jobs**: The number of jobs currently residing in this queue.
  - Format: `Integer`
  - Q Type: R, E
  - Val / Opt: None
  - Value/Option Description: None
  - Default Value: int
  - Python Type: int
  - User Access: r
  - Operator Access: r, r, r

# 6.10 Vnode Attributes

Vnode attributes are divided into the following groups:

- Those that can be set by an operator or manager
- Those that are read-only

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Format</th>
<th>Val / Opt</th>
<th>Value/Option Description</th>
<th>Def Val</th>
<th>Python Type</th>
<th>In</th>
<th>Out</th>
<th>Mod</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Information about this vnode. This attribute may be set by the manager to any string to inform users of any information relating to the node. If this attribute is not explicitly set, the PBS server will use the attribute to pass information about the node status, specifically why the node is down. If the attribute is explicitly set by the manager, it will not be modified by the server.</td>
<td>String</td>
<td></td>
<td></td>
<td>None</td>
<td>str</td>
<td>r</td>
<td>r</td>
<td>r,w</td>
</tr>
<tr>
<td>current_aoe</td>
<td>This attribute identifies the AOE currently instantiated on this vnode. Case-sensitive. Cannot be set on server's host.</td>
<td>String</td>
<td></td>
<td></td>
<td>Unset</td>
<td>str</td>
<td>r</td>
<td>r</td>
<td>r,w</td>
</tr>
<tr>
<td>hpcbp_enable</td>
<td>Enables HPCBP features in Linux MoM.</td>
<td>Boolean</td>
<td></td>
<td></td>
<td>False</td>
<td>bool</td>
<td>r</td>
<td>r</td>
<td>r,w</td>
</tr>
</tbody>
</table>

The following attributes can be set by a manager or operator:

6.11 Job Attributes

Job attributes are divided into the following groups:

• Those that can be set by users, operators, or managers
• Those that are read-only

<table>
<thead>
<tr>

<td><strong>exec_host</strong></td>
<td>If the job is running, this is set to the name of the host or hosts on which the job is executing.</td>
<td><strong>String</strong>: Form: <code>host/N[&quot;C&quot;]*[+...]</code>, where &quot;host&quot; is the name of the host, “N” is task slot number starting at 0, on that node, and “C” is the number of CPUs allocated to the job. &quot;&quot;&quot;C&quot;&quot; does not appear if its value is one.</td>
<td></td>
<td></td>
<td></td>
<td>None</td>
<td>pbs.exec_host</td>
<td>r</td>
<td>i</td>
</tr>
</tbody>
</table>
**Attributes**

### exec_vnode

List of chunks for the job. Each chunk shows the name of the vnode(s) from which it is taken, along with the host-level, consumable resources allocated from that vnode, and any AOE provisioned on this vnode for this job. If a vnode is allocated to the job but no resources from the vnode are used by the job, the vnode name appears alone. If a chunk is split across vnodes, the name of each vnode and its resources appear inside one pair of parentheses, joined with a plus (“+”) sign.

Each chunk is enclosed in parentheses. Chunks are connected by plus signs. For a job which requested two chunks satisfied by resources from three vnodes, \( \text{exec\_vnode} \) is:

\[
(vnodeA:ncpus=N:mem=X) + (nodeB:ncpus=P:mem=Y + nodeC:mem=Z)
\]

### Exit_status

Exit status of job. Set to zero for successful execution. If any sub-job of an array job has non-zero exit status, the array job has non-zero exit status.

## Attributes

### User List
The list of users which determines the user name under which the job is run on a given host. No length limit. When a job is to be executed, the server selects a user name from the list according to the following ordered set of rules:
1. Select the user name from the list for which the associated host name matches the name of the server.
2. Select the user name which has no associated host name; the wildcard name.
3. Use the Job_Owner as the user name.

**Format:** String. Form: 
```
"user@host [user@host...]"
```
Must be enclosed in double quotes if it contains commas. May be up to 256 characters in length.

**Default Value:** None

**Python Type:** Dictionary:

```
Variable_List[<variable name>]=<value> where <resource name> is any built-in or custom resource
```

<table>

```
Must be enclosed in double quotes if it contains commas. |          |                          | None | Dictionary:  |       |             | r, w | w, w | r, w |
### 6.12 Hook Attributes

An unset hook attribute takes the default value for that attribute.

Hook attributes can be set by root only.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Format</th>
<th>Value/Option Description</th>
<th>Default Value</th>
<th>Python Type</th>
<th>U</th>
<th>D</th>
<th>Op</th>
<th>Mgr</th>

</tr>
</tbody>
</table>
This chapter describes the formats used in PBS Professional.

7.1 List of Formats

**PBS NAME**
This is a generic term, used to describe various PBS entities. For example, attribute names are PBS NAMEs.
Must start with an alphabetic character, and may contain only the following: alphanumeric, underscore (“_”), or dash (“-”).

**Accounting Log Entry**

```
logfile-date-time;record-type;id-string;message-text
```
where

- `logfile-date-time`
  Date and time stamp in the format:
  `mm/dd/yyyy hh:mm:ss`

- `record-type`
  A single character indicating the type of record

- `id-string`
  The job or reservation identifier

- `message-text`
  Format: blank-separated `keyword=value` fields.
  Message text is ASCII text.
  Content depends on the record type.

**Attribute Name**
PBS NAME. Cannot be used for a vnode name.

**Boolean**
Name of resource is a string.
Values:
Chapter 7

Formats

TRUE, True, true, T, t, Y, y, 1
FALSE, False, false, F, f, N, n, 0

Date
<Day of week> <Name of month> <Day of month> <HH:MM:SS> <YYYY>

Datetime

Table 7-1: Datetime Symbols

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>Century</td>
</tr>
<tr>
<td>YY</td>
<td>Year</td>
</tr>
<tr>
<td>MM</td>
<td>Month</td>
</tr>
<tr>
<td>DD</td>
<td>Day of month</td>
</tr>
<tr>
<td>hh</td>
<td>Hour</td>
</tr>
<tr>
<td>mm</td>
<td>Minute</td>
</tr>
<tr>
<td>SS</td>
<td>Second</td>
</tr>
</tbody>
</table>

When setting the value, each portion of the date defaults to the current date, as long
as the next-smaller portion is in the future. For example, if today is the 3rd of
the month and the specified day DD is the 5th, the month MM will be set to the current
month.

If a specified portion has already passed, the next-larger portion will be set to one
after the current date. For example, if the day DD is not specified, but the hour hh is
specified to be 10:00 a.m. and the current time is 11:00 a.m., the day DD will be set
to tomorrow.

Unspecified portions default to now.

Destination Identifier
String used to specify a particular destination. The identifier may be specified in one
of three forms:
Formats

<queue name>@<server name>
<queue name>
@<server name>

where <queue name> is an ASCII character string of up to 15 characters. Valid characters are alphanumerics, the hyphen and the underscore. The string must begin with a letter.

Duration
A period of time, expressed either as
integer seconds
or
[[hours:]minutes:]seconds[.milliseconds]
in the form:
[[HH:]MM:]SS[.milliseconds]
Note that milliseconds are rounded to nearest second.

Float
Floating point. Allowable values: [+.-] 0-9 [[0-9] ...][.][[0-9] ...]

Host Name
String of the form
name.domain
where domain is a hierarchical, dot-separated list of subdomains. Therefore, a host name cannot contain a dot, "." as a legal character other than as a subdomain separator.
The name must not contain the commercial at sign, "@", as this is often used to separate a file from the host in a remote file name.
A host name cannot contain a colon, ":".
The maximum length of a host name supported by PBS is defined by PBS_MAXHOSTNAME, and is 255.

Job Array Identifier
Job array identifiers are a sequence number followed by square brackets:
sequence_number[].[server_name][@server]
Example:
1234[]
Note that some shells require that you enclose a job array ID in double quotes.
**Chapter 7**

**Formats**

---

**Job Array Range**

\[sequence_number[<first>-<last>@server]\]

*first* and *last* are the first and last indices of the subjobs.

**Job Identifier**

\[sequence_number@server]\]

Format:

\[[0-9]+[\[0-9]+]:].IP_HOSTNAME[.IP_DOMAINNAME]

**Job Name, Job Array Name**

A job name or job array name can be at most 236 characters. It must consist of printable, non-whitespace characters. The first character must be alphabetic, numeric, plus sign (“+”), dash or minus (“-”), or underscore (“_”). The name must not contain special characters.
Limit Specification

\( \text{limit-spec=} \text{limit}, \text{limit-spec=} \text{limit}, \ldots \)

where \text{limit-spec} is:

Table 7-2: Limit Specification Syntax

<table>
<thead>
<tr>
<th>Limit</th>
<th>limit-spec</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall limit</td>
<td>( \alpha: \text{PBS_ALL} )</td>
</tr>
<tr>
<td>Generic users</td>
<td>( \nu: \text{PBS_GENERIC} )</td>
</tr>
<tr>
<td>An individual user</td>
<td>( \nu:&lt;\text{username}&gt; )</td>
</tr>
<tr>
<td>Generic groups</td>
<td>( \gamma: \text{PBS_GENERIC} )</td>
</tr>
<tr>
<td>An individual group</td>
<td>( \gamma:&lt;\text{group name}&gt; )</td>
</tr>
<tr>
<td>Generic projects</td>
<td>( \pi: \text{PBS_GENERIC} )</td>
</tr>
<tr>
<td>An individual project</td>
<td>( \pi:&lt;\text{project name}&gt; )</td>
</tr>
</tbody>
</table>

- The \text{limit-spec} can contain spaces anywhere except after the colon (“:”).
- If there are comma-separated \text{limit-specs}, the entire string must be enclosed in double quotes.
- A username, group name, or project name containing spaces must be enclosed in quotes.
- If a username, group name, or project name is quoted using double quotes, and the entire string requires quotes, the outer enclosing quotes must be single quotes. Similarly, if the inner quotes are single quotes, the outer quotes must be double quotes.
- \text{PBS\_ALL} is a keyword which indicates that this limit applies to the usage total.
- \text{PBS\_GENERIC} is a keyword which indicates that this limit applies to generic users or groups.
- When removing a limit, the limit value does not need to be specified.
- \text{PBS\_ALL} and \text{PBS\_GENERIC} are case-sensitive.

Format for setting a limit attribute:

\[
\text{set server <limit attribute> = } \text{“[limit-spec=<limit>], [limit-spec=<limit>],...”}
\]

\[
\text{set <queue> <queue name> <limit attribute> = ”[limit-spec=<limit>], [limit-}
\]
Chapter 7  

**Formats**

`spec=<limit>[,...]```

For example, to set the `max_queued` limit on QueueA to 5 for total usage, and to limit user bill to 3:

```
Qmgr: s q QueueA max_queued = "[o:PBS_ALL=5], [u:bill =3]"
```

See "How to Set Limits at Server and Queues" on page 401 in the PBS Professional Administrator’s Guide.

**logfile-date-time**

Date and time stamp in the format:

`mm/dd/yyyy hh:mm:ss`

**long**

Long integer. Allowable values: 0-9 [0-9] ...

**pathname**

All printable characters except for colon (":"), quotes(""""), and ampersand ("&")

**Queue Identifier**

To specify a queue at the default server:

`<queue name>`

To specify all queues at a server:

`@<server name>`

To specify a queue at a specific server:

`<queue name>@<server name>`

**Queue Name**

PBS NAME

**Reservation Name**

Limit is 236 characters.

**Resource Name**

PBS NAME

Resource names are case-insensitive.

**Resource Value**

- PBS NAME, or
- Anything inside double quotes

The format of each data type is defined for that data type. For example, float resources are defined above, in "Float" on page 423.
Size

Number of bytes or words. The size of a word is 64 bits.

Default: bytes

Format:

$integer[suffix]$

where $suffix$ can be one of the following:

Table 7-3: Size in Bytes

<table>
<thead>
<tr>
<th>Suffix</th>
<th>Meaning</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>b or w</td>
<td>Bytes or words</td>
<td>1</td>
</tr>
<tr>
<td>kb or kw</td>
<td>Kilobytes or kilowords</td>
<td>2 to the 10th, or 1024</td>
</tr>
<tr>
<td>mb or mw</td>
<td>Megabytes or megawords</td>
<td>2 to the 20th, or 1,048,576</td>
</tr>
<tr>
<td>gb or gw</td>
<td>Gigabytes or gigawords</td>
<td>2 to the 30th, or 1,073,741,824</td>
</tr>
<tr>
<td>tb or tw</td>
<td>Terabytes or terawords</td>
<td>2 to the 40th, or 1024 gigabytes</td>
</tr>
<tr>
<td>pb or pw</td>
<td>Petabytes or petawords</td>
<td>2 to the 50th, or 1,048,576 gigabytes</td>
</tr>
</tbody>
</table>

String (resource value)

Any character, including the space character.

Only one of the two types of quote characters, " or ", may appear in any given value.

Values: [_a-zA-Z0-9][-_a-zA-Z0-9 ! # $ %´( )*+,./;:\=?>@[\]^_`{|}~]...

String resource values are case-sensitive.

string_array

Comma-separated list of strings. Strings in string_array may not contain commas.

No limit on length.

Subjob Identifier

Subjob identifiers are a sequence number followed by square brackets enclosing the subjob’s index:

$sequence_number[index][.server_name][@server]$

Example:

1234[99]
Chapter 7  Formats

User Name
String up to 16 characters in length. PBS supports names containing any printable, non-whitespace character except the at sign (“@”). Your platform may place additional limitations on user names.

User Name, Windows
Must conform to the POSIX-1 standard for portability:

• The username must contain only alphanumeric characters, dot (.), underscore (_), and/or hyphen ".".
• The hyphen must not be the first letter of the username.
• If "@" appears in the username, then it will assumed to be in the context of a Windows domain account: username@domainname.
• An exception to the above rule is the space character, which is allowed. If a space character appears in a username string, then it will be displayed quoted and must be specified in a quoted manner.

Vnode Name

• For the natural vnode, the vnode name must conform to legal name for a host
• For other vnodes, the vnode name can be alphanumeric and any of these:
  - (dash)
  _ (underscore)
  @ (at sign)
  [ (left bracket)
  ] (right bracket)
  # (hash)
  ^ (caret)
  / (slash)
  \ (backslash)
  . (period)
• Cannot be the same as an attribute name
This chapter lists and describes the states in PBS Professional.

8.1 **Job States**

Job states are abbreviated to one character.

**Table 8-1: Job States**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Job arrays only: job array is begun</td>
</tr>
<tr>
<td>E</td>
<td>Job is exiting after having run</td>
</tr>
<tr>
<td>F</td>
<td>Job is finished. Job has completed execution, job failed during execution, or job was deleted.</td>
</tr>
<tr>
<td>H</td>
<td>Job is held. A job is put into a held state by the server or by a user or administrator. A job stays in a held state until it is released by a user or administrator.</td>
</tr>
<tr>
<td>M</td>
<td>Job was moved to another server</td>
</tr>
<tr>
<td>Q</td>
<td>Job is queued, eligible to run or be routed</td>
</tr>
<tr>
<td>R</td>
<td>Job is running</td>
</tr>
<tr>
<td>S</td>
<td>Job is suspended by server. A job is put into the suspended state when a higher priority job needs the resources.</td>
</tr>
<tr>
<td>T</td>
<td>Job is in transition (being moved to a new location)</td>
</tr>
<tr>
<td>U</td>
<td>Job is suspended due to workstation becoming busy</td>
</tr>
<tr>
<td>W</td>
<td>Job is waiting for its requested execution time to be reached or job specified a stage in request which failed for some reason.</td>
</tr>
<tr>
<td>X</td>
<td>Subjobs only; subjob is finished (expired.)</td>
</tr>
</tbody>
</table>
8.1.1 Job Substates

Job substates are numeric:

<table>
<thead>
<tr>
<th>Substate Number</th>
<th>Substate Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Transit in, prior to waiting for commit</td>
</tr>
<tr>
<td>01</td>
<td>Transit in, waiting for commit</td>
</tr>
<tr>
<td>02</td>
<td>transiting job outbound, not ready to commit</td>
</tr>
<tr>
<td>03</td>
<td>transiting outbound, ready to commit</td>
</tr>
<tr>
<td>10</td>
<td>job queued and ready for selection</td>
</tr>
<tr>
<td>11</td>
<td>job queued, has files to stage in</td>
</tr>
<tr>
<td>14</td>
<td>job staging in files before waiting</td>
</tr>
<tr>
<td>15</td>
<td>job staging in files before running</td>
</tr>
<tr>
<td>16</td>
<td>job stage in complete</td>
</tr>
<tr>
<td>20</td>
<td>job held - user or operator</td>
</tr>
<tr>
<td>22</td>
<td>job held - waiting on dependency</td>
</tr>
<tr>
<td>30</td>
<td>job waiting until user-specified execution time</td>
</tr>
<tr>
<td>37</td>
<td>job held - file stage in failed</td>
</tr>
<tr>
<td>41</td>
<td>job sent to MoM to run</td>
</tr>
<tr>
<td>42</td>
<td>Running</td>
</tr>
<tr>
<td>43</td>
<td>Suspended by Operator or Manager</td>
</tr>
<tr>
<td>44</td>
<td>PBS no longer supports Globus. The Globus functionality has been <strong>removed</strong> from PBS.</td>
</tr>
<tr>
<td></td>
<td>Job sent to run under Globus</td>
</tr>
<tr>
<td>45</td>
<td>Suspended by Scheduler</td>
</tr>
</tbody>
</table>
### Table 8-2: Job Substates

<table>
<thead>
<tr>
<th>Substate Number</th>
<th>Substate Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>50</td>
<td>Server received job obit</td>
</tr>
<tr>
<td>51</td>
<td>Staging out stdout/err and other files</td>
</tr>
<tr>
<td>52</td>
<td>Deleting stdout/err files and staged-in files</td>
</tr>
<tr>
<td>53</td>
<td>Mom releasing resources</td>
</tr>
<tr>
<td>54</td>
<td>job is being aborted by server</td>
</tr>
<tr>
<td>56</td>
<td>(Set by MoM) Mother Superior telling sisters to kill everything</td>
</tr>
<tr>
<td>57</td>
<td>(Set by MoM) job epilogue running</td>
</tr>
<tr>
<td>58</td>
<td>(Set by MoM) job obit notice sent</td>
</tr>
<tr>
<td>59</td>
<td>Waiting for site &quot;job termination&quot; action script</td>
</tr>
<tr>
<td>60</td>
<td>Job to be rerun, MoM sending stdout/stderr back to server</td>
</tr>
<tr>
<td>61</td>
<td>Job to be rerun, staging out files</td>
</tr>
<tr>
<td>62</td>
<td>Job to be rerun, deleting files</td>
</tr>
<tr>
<td>63</td>
<td>Job to be rerun, freeing resources</td>
</tr>
<tr>
<td>70</td>
<td>Array job has begun</td>
</tr>
<tr>
<td>71</td>
<td>Job is waiting for vnode(s) to be provisioned with its requested AOE.</td>
</tr>
<tr>
<td>153</td>
<td>(Set by MoM) Mother Superior waiting for delete ACK from sisters</td>
</tr>
</tbody>
</table>
8.2 Job Array States

Job array states map closely to job states except for the ‘B’ state. The ‘B’ state applies to job arrays and indicates that at least one subjob has left the queued state and is running or has run, but not all subjobs have run. Job arrays will never be in the ‘R’, ‘S’ or ‘U’ states.

Table 8-3: Job Array States

<table>
<thead>
<tr>
<th>State</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>The job array has started</td>
</tr>
<tr>
<td>E</td>
<td>All subjobs are finished and the server is cleaning up the job array</td>
</tr>
<tr>
<td>F</td>
<td>The job array is finished</td>
</tr>
<tr>
<td>H</td>
<td>The job array is held</td>
</tr>
<tr>
<td>Q</td>
<td>The job array is queued, or has been rerun</td>
</tr>
<tr>
<td>T</td>
<td>The job array is in transit between servers</td>
</tr>
<tr>
<td>W</td>
<td>The job array has a wait time in the future</td>
</tr>
</tbody>
</table>

8.3 Subjob States

Subjobs can be in one of six states, listed here.

Table 8-4: Subjob States

<table>
<thead>
<tr>
<th>State</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>Ending</td>
</tr>
<tr>
<td>F</td>
<td>Finished</td>
</tr>
<tr>
<td>Q</td>
<td>Queued</td>
</tr>
<tr>
<td>R</td>
<td>Running</td>
</tr>
<tr>
<td>S</td>
<td>Suspended</td>
</tr>
<tr>
<td>U</td>
<td>Suspended by keyboard activity</td>
</tr>
</tbody>
</table>
The state of the server is shown in the `server_state` server attribute. Possible values are shown in the following table:

### Table 8-5: Server States

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Hot_Start**     | The server has been started so that it will run first any jobs that were running when the server was shut down.  
Python type: pbs.SV_STATE_HOT |
| **Idle**          | The server is running. The Scheduler is between scheduling cycles.  
Python type: pbs.SV_STATE_IDLE |
| **Scheduling**    | The server is running. The Scheduler is in a scheduling cycle.  
Python type: pbs.SV_STATE_ACTIVE |
| **Terminating**   | The server is terminating.  
Python type: pbs.SV_STATE_SHUTIMM or pbs.SV_STATE_SHUTSIG |
| **Terminating_Delayed** | The server is terminating in delayed mode. No new jobs will be run, and the server will shut down when the last running job finishes.  
Python type: pbs.SV_STATE_SHUTDEL |
### 8.5 Vnode States

If a vnode’s state attribute is unset, that is equivalent to the state being *free*. A vnode’s state is shown in its state attribute, which can take on zero or more of the values listed here. Some vnode state values can be set simultaneously. Values are:

<table>
<thead>
<tr>
<th>State</th>
<th>Set By</th>
<th>Description</th>
<th>Can Combine With these States</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>busy</em></td>
<td>Server</td>
<td>Node is up and has load average greater than <code>max_load</code>, or is showing keyboard or mouse activity. When the loadave is above <code>max_load</code>, that node is marked <em>busy</em>. The scheduler won’t place jobs on a node marked <em>busy</em>. When the loadave drops below <code>ideal_load</code>, or when the mouse and keyboard have not shown any activity for a specified amount of time, the <em>busy</em> mark is removed. Consult your OS documentation to determine values that make sense.</td>
<td><em>offline</em></td>
</tr>
<tr>
<td><em>down</em></td>
<td>Server</td>
<td>Node is not usable. Existing communication lost between server and MoM.</td>
<td>Cannot be set with <em>free</em></td>
</tr>
<tr>
<td><em>free</em></td>
<td>Server</td>
<td>Node is up and has available CPU(s). Server will mark a vnode “<em>free</em>” on first successful ping after vnode was “<em>down</em>”.</td>
<td>None</td>
</tr>
<tr>
<td><em>job-busy</em></td>
<td>Server</td>
<td>Node is up and all CPUs are allocated to jobs.</td>
<td><em>offline</em> <em>resv-exclusive</em></td>
</tr>
</tbody>
</table>
## Table 8-6: Vnode States

<table>
<thead>
<tr>
<th>State</th>
<th>Set By</th>
<th>Description</th>
<th>Can Combine With these States</th>
</tr>
</thead>
<tbody>
<tr>
<td>job-exclusive</td>
<td>Server</td>
<td>Node is up and has been allocated exclusively to a single job.</td>
<td>offline</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>resv-exclusive</td>
</tr>
<tr>
<td>offline</td>
<td>Manager/Operator</td>
<td>Node is not usable. Jobs running on this vnode will continue to run.</td>
<td>busy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Used by Manager/Operator to mark a vnode not to be used for jobs.</td>
<td>job-busy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>job-exclusive</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>resv-exclusive</td>
</tr>
<tr>
<td>provisioning</td>
<td>Server</td>
<td>A vnode is in the provisioning state while it is in the process of being provisioned. No jobs are run on vnodes in the provisioning state.</td>
<td>Cannot be set with any other states</td>
</tr>
<tr>
<td>resv-exclusive</td>
<td>Server</td>
<td>Reservation has requested exclusive use of vnode, and reservation is running.</td>
<td>job-exclusive, offline</td>
</tr>
<tr>
<td>stale</td>
<td>Server</td>
<td>MoM managing vnode is not reporting any information about this vnode, but was reporting it previously. Server can still communicate with MoM. A vnode becomes stale when: 1. A vnode is defined in the server 2. MoM starts or restarts and reports a set of vnodes according to her configuration 3. A vnode which existed in the server earlier is not in the set being reported now by MoM 4. That vnode is marked &quot;stale&quot;</td>
<td>Cannot be set with free</td>
</tr>
</tbody>
</table>
### Chapter 8

#### States

Table 8-6: Vnode States

<table>
<thead>
<tr>
<th>State</th>
<th>Set By</th>
<th>Description</th>
<th>Can Combine With these States</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>state-unknown, down</code></td>
<td>Server</td>
<td>Node is not usable. Since server’s latest start, no communication with this vnode. May be network or hardware problem, or no MoM on vnode.</td>
<td></td>
</tr>
<tr>
<td>unresolvable</td>
<td>Server</td>
<td>Server cannot resolve name of vnode</td>
<td></td>
</tr>
<tr>
<td><code>wait-provisioning</code></td>
<td>Server</td>
<td>There is a limit on the maximum number of vnodes that can be in the provisioning state. This limit is specified in the server’s <code>max_concurrent_provision</code> attribute. If a vnode is to be provisioned, but cannot because the number of concurrently provisioning vnodes has reached the specified maximum, the vnode goes into the <code>wait-provisioning state</code>. No jobs are run on vnodes in the <code>wait-provisioning state</code>.</td>
<td>Cannot be set with any other states</td>
</tr>
</tbody>
</table>

---

**Table 8-6: Vnode States**

<table>
<thead>
<tr>
<th>State</th>
<th>Set By</th>
<th>Description</th>
<th>Can Combine With these States</th>

<td>Node is not usable. Since server’s latest start, no communication with this vnode. May be network or hardware problem, or no MoM on vnode.</td>
<td></td>
</tr>
<tr>
<td>unresolvable</td>
<td>Server</td>
<td>Server cannot resolve name of vnode</td>
<td></td>
</tr>
<tr>
<td><code>wait-provisioning</code></td>
<td>Server</td>
<td>There is a limit on the maximum number of vnodes that can be in the provisioning state. This limit is specified in the server’s <code>max_concurrent_provision</code> attribute. If a vnode is to be provisioned, but cannot because the number of concurrently provisioning vnodes has reached the specified maximum, the vnode goes into the <code>wait-provisioning state</code>. No jobs are run on vnodes in the <code>wait-provisioning state</code>.</td>
<td>Cannot be set with any other states</td>
</tr>
</tbody>
</table>
8.6 Reservation States

The following table shows the list of possible states for a reservation. The states that you will usually see are CO, UN, BD, and RN, although a reservation usually remains unconfirmed for too short a time to see that state.

Table 8-7: Reservation States

<table>
<thead>
<tr>
<th>Code</th>
<th>Numeric</th>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BD</td>
<td>7</td>
<td>RESV_BEING_DELETED</td>
<td>Transitory state; reservation is being deleted</td>
</tr>
<tr>
<td>CO</td>
<td>2</td>
<td>RESV_CONFIRMED</td>
<td>Reservation confirmed</td>
</tr>
<tr>
<td>DG</td>
<td>10</td>
<td>RESV_DEGRADED</td>
<td>vnode(s) allocated to reservation unavailable</td>
</tr>
<tr>
<td>DE</td>
<td>8</td>
<td>RESV_DELETED</td>
<td>Transitory state; reservation has been deleted</td>
</tr>
<tr>
<td>DJ</td>
<td>9</td>
<td>RESV_DELETING_JOBS</td>
<td>Jobs remaining after reservation’s end time being deleted</td>
</tr>
<tr>
<td>FN</td>
<td>6</td>
<td>RESV_FINISHED</td>
<td>Transitory state; reservation’s end time has arrived and reservation will be deleted</td>
</tr>
<tr>
<td>NO</td>
<td>0</td>
<td>RESV_NONE</td>
<td>No reservation yet</td>
</tr>
<tr>
<td>RN</td>
<td>5</td>
<td>RESV_RUNNING</td>
<td>Time period from reservation’s start time to end time is being traversed</td>
</tr>
<tr>
<td>TR</td>
<td>4</td>
<td>RESV_TIME_TO_RUN</td>
<td>Transitory state; reservation’s start time has arrived</td>
</tr>
<tr>
<td>UN</td>
<td>1</td>
<td>RESV_UNCONFIRMED</td>
<td>Reservation not confirmed</td>
</tr>
<tr>
<td>WT</td>
<td>3</td>
<td>RESV_WAIT</td>
<td>Unused</td>
</tr>
</tbody>
</table>
### 8.6.1 Degraded Reservation Substates

The following table shows states and substates for degraded reservations:

**Table 8-8: Degraded Reservation States and Substates**

<table>
<thead>
<tr>
<th>Occurrence Type</th>
<th>State or Substate</th>
<th>Reservation Time in Future</th>
<th>Reservation Time Is Now</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advance Reservation State</td>
<td>RESV_DEGRADED</td>
<td>RESV_RUNNING</td>
<td></td>
</tr>
<tr>
<td>Advance Reservation Substate</td>
<td>RESV_DEGRADED</td>
<td>RESV_DEGRADED</td>

</tr>
<tr>
<td>Soonest Occurrence State</td>
<td>RESV_DEGRADED</td>
<td>RESV_RUNNING</td>
<td></td>
</tr>
<tr>
<td>Soonest Occurrence Substate</td>
<td>RESV_DEGRADED</td>
<td>RESV_DEGRADED</td>
<td></td>
</tr>
<tr>
<td>Non-soonest Occurrence Only State</td>
<td>RESV_CONFIRMED</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>Non-soonest Occurrence Only Substate</td>
<td>RESV_DEGRADED</td>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>
This chapter describes the accounting log. The PBS accounting log is a text file with each entry terminated by a newline. There is no limit to the size of an entry.

### 9.1 Log Entry Format

The format of an entry is:

```
logfile-date-time;record-type;id-string;message-text
```

where

- **logfile-date-time**
  
  Date and time stamp in the format:
  
  `mm/dd/yyyy hh:mm:ss`

- **record-type**
  
  A single character indicating the type of record

- **id-string**
  
  The job or reservation identifier

- **message-text**
  
  Message text format is blank-separated `keyword=value` fields.
  Message text is ASCII text.
  Content depends on the record type.
  There is no dependable ordering of the content of each message.

#### 9.1.1 Resources

Values for requested resources are written in the same units as those in the resource requests. Values for `resources_used` and `resources_assigned` are written in kb. A suffix is always written unless the quantity is measured in bytes.
Chapter 9  

**Accounting Log**

For Resource_List and resources_used, there is one entry per resource, corresponding to the resources requested and used, respectively.

If a job ends between MoM poll cycles, resources_used.RES numbers will be slightly lower than they are in reality. For long-running jobs, the error percentage will be minor.

### 9.2 Record Types

The record types are:

A

Job was aborted by the server.

B

Beginning of reservation period. If the log entry is for a reservation, the message-text field contains information describing the specified reservation. Possible information includes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner=ownename</td>
<td>Name of party who submitted the reservation request.</td>
</tr>
<tr>
<td>name=reservation_name</td>

C
Job was checkpointed and held.

D
Job was deleted by request. The message-text will contain requestor=user@host to identify who deleted the job.

E
Job ended (terminated execution). In this case, the message-text field contains information about the job. The end of job accounting record will not be written until all of the resources have been freed. The “end” entry in the job end record will include
the time to stage out files, delete files, and free the resources. This will not change the recorded walltime for the job. Possible information includes:

This chapter shows some configuration-specific scenarios which will hopefully clarify any configuration questions. Several configuration models are discussed, followed by several complex examples of specific features.

- Single Vnode System
- Single Vnode System with Separate PBS server
- Multi-vnode complex
- Complex Multi-level Route Queues (including group ACLs)
- Multiple User ACLs

For each of these possible configuration models, the following information is provided:

- General description for the configuration model
- Type of system for which the model is well suited
- Contents of server nodes file
- Any required server configuration
- Any required MoM configuration
- Any required Scheduler configuration
10.1 Single Vnode System

Running PBS on a single vnode/host as a standalone system is the least complex configuration. This model is most applicable to sites who have a single large server system. In this model, all PBS components run on the same host, which is the same host on which jobs will be executed. The following illustration shows how communication works when PBS is on a single host in TPP mode. For more on TPP mode, see Chapter 4, "Communication", on page 87.

For this example, let’s assume we have a 32-CPU server machine named “mars”. We want users to log into mars and jobs will be run via PBS on mars.

In this configuration, the server’s default nodes file (which should contain the name of the host on which the server was installed) is sufficient. Our example nodes file would contain only one entry: mars

The default MoM and Scheduler config files, as well as the default queue/Server limits are also sufficient in order to run jobs. No changes are required from the default configuration, however, you may wish to customize PBS to your site.
10.2 Separate Server and Execution Host

A variation on the model presented above would be to provide a “front-end” system that ran the PBS server, scheduler, and communication daemons, and from which users submitted their jobs. Only the MoM would run on our execution server, mars. This model is recommended when the user load would otherwise interfere with the computational load on the server. The following illustration shows how communication works when the PBS server and scheduler are on a front-end system and MoM is on a separate host, in TPP mode. For more on TPP mode, see Chapter 4, "Communication", on page 87.

[Diagram of PBS daemons on single execution system with front end]

In this case, the PBS server_priv/nodes file would contain the name of our execution server mars, but this may not be what was written to the file during installation, depending on which options were selected. It is possible the hostname of the machine on which the server was installed was added to the file, in which case you would need to use `qmgr(1B)` to manipulate the contents to contain one vnode: mars. If the default scheduling policy, based on available CPUs and memory, meets your requirements, then no changes are required in either the MoM or Scheduler configuration files.

However, if you wish the execution host (mars) to be scheduled based on load average, the following changes are needed. Edit MoM's mom_priv/config file so that it contains the target and maximum load averages:

```
$ideal_load 30
$max_load 32
```
In the Scheduler sched_priv/sched_config file, the following options would need to be set:

\[
\text{load\_balancing: True all}
\]

### 10.3 Multiple Execution Hosts

The multi-vnode complex model is a very common configuration for PBS. In this model, there is typically a front-end system as we saw in the previous example, with a number of back-end execution hosts. The PBS server, scheduler, and communication daemons are typically run on the front-end system, and a MoM is run on each of the execution hosts, as shown in the diagram to the right.

In this model, the server's `nodes` file will need to contain the list of all the vnodes in the complex.

The MoM `config` file on each vnode will need two static resources added, to specify the target load for each vnode. If we assume each of the vnodes in our “planets” cluster is a 32-processor system, then the following example shows what might be desirable ideal and maximum load values to add to the MoM `config` files:

\[
\text{
$\text{ideal\_load} \ 30$

$\text{max\_load} \ 32$
}
\]

Furthermore, suppose we want the Scheduler to load balance the workload across the available vnodes, making sure not to run two jobs in a row on the same vnode. We accomplish this by editing the Scheduler configuration file and enabling load balancing:

\[
\text{load\_balancing: True all}
\]

\[
\text{smp\_cluster\_dist: \text{round\_robin}}
\]
The following diagram illustrates this for an eight-host complex in TPP mode.

Figure 10-3: Typical PBS daemon locations for multiple execution hosts

This diagram illustrates a multi-vnode complex TPP configuration wherein the server and scheduler daemons communicate with the MoMs on the execution hosts via the communication daemon. Jobs are submitted to the server, scheduled for execution by the Scheduler, and then transferred to a MoM when it’s time to be run. MoM periodically sends status information back to the server, and answers resource requests from the Scheduler.
10.4 Complex Multi-level Route Queues

There are times when a site may wish to create a series of route queues in order to filter jobs, based on specific resources, or possibly to different destinations. For this example, consider a site that has two large server systems, and a Linux cluster. The Administrator wants to configure route queues such that everyone submits jobs to a single queue, but the jobs get routed based on (1) requested architecture and (2) individual group IDs. In other words, users request the architecture they want, and PBS finds the right queue for them. Only groups “math”, “chemistry”, and “physics” are permitted to use either server systems; while anyone can use the cluster. Lastly, the jobs coming into the cluster should be divided into three separate queues for long, short, and normal jobs. But the “long” queue was created for the astronomy department, so only members of that group should be permitted into that queue. Given these requirements, let’s look at how we would set up such a collection of route queues. (Note that this is only one way to accomplish this task. There are various other ways too.)

First we create a queue to which everyone will submit their jobs. Let’s call it “submit”. It will need to be a route queue with three destinations, as shown:

```
Qmgr: create queue submit
Qmgr: set queue submit queue_type = Route
Qmgr: set queue submit route_destinations = server_1
Qmgr: set queue submit route_destinations += server_2
Qmgr: set queue submit route_destinations += cluster
Qmgr: set queue submit enabled = True
Qmgr: set queue submit started = True
```

Now we need to create the destination queues. (Notice in the above example, we have already decided what to call the three destinations: server_1, server_2, cluster.) First we create the server_1 queue, complete with a group ACL, and a specific architecture limit.

```
Qmgr: create queue server_1
Qmgr: set queue server_1 queue_type = Execution
Qmgr: set queue server_1 from_route_only = True
Qmgr: set queue server_1 resources_max.arch = linux
Qmgr: set queue server_1 resources_min.arch = linux
Qmgr: set queue server_1 acl_group_enable = True
Qmgr: set queue server_1 acl_groups = math
Qmgr: set queue server_1 acl_groups += chemistry
Qmgr: set queue server_1 acl_groups += physics
Qmgr: set queue server_1 enabled = True
Qmgr: set queue server_1 started = True
```
Next we create the queues for server_2 and cluster. Note that the server_2 queue is very similar to the server_1 queue, only the architecture differs. Also notice that the cluster queue is another route queue, with multiple destinations.

```
Qmgr: create queue server_2
Qmgr: set queue server_2 queue_type = Execution
Qmgr: set queue server_2 from_route_only = True
Qmgr: set queue server_2 resources_max.arch = sv2
Qmgr: set queue server_2 resources_min.arch = sv2
Qmgr: set queue server_2 acl_group_enable = True
Qmgr: set queue server_2 acl_groups = math
Qmgr: set queue server_2 acl_groups += chemistry
Qmgr: set queue server_2 acl_groups += physics
Qmgr: set queue server_2 enabled = True
Qmgr: set queue server_2 started = True
Qmgr: create queue cluster
Qmgr: set queue cluster queue_type = Route
Qmgr: set queue cluster from_route_only = True
Qmgr: set queue cluster resources_max.arch = linux
Qmgr: set queue cluster resources_min.arch = linux
Qmgr: set queue cluster route_destinations = long
Qmgr: set queue cluster route_destinations += short
Qmgr: set queue cluster route_destinations += medium
Qmgr: set queue cluster enabled = True
Qmgr: set queue cluster started = True
```
In the cluster queue above, you will notice the particular order of the three destination queues (`long`, `short`, `medium`). PBS will attempt to route a job into the destination queues in the order specified. Thus, we want PBS to first try the `long` queue (which will have an ACL on it), then the `short` queue (with its short time limits). Thus any jobs that had not been routed into any other queues (server or cluster) will end up in the `medium` cluster queue. Now to create the remaining queues.

```
Qmgr: create queue long
Qmgr: set queue long queue_type = Execution
Qmgr: set queue long from_route_only = True
Qmgr: set queue long resources_max.cput = 20:00:00
Qmgr: set queue long resources_max.walltime = 20:00:00
Qmgr: set queue long resources_min.cput = 02:00:00
Qmgr: set queue long resources_min.walltime = 03:00:00
Qmgr: set queue long acl_group_enable = True
Qmgr: set queue long acl_groups = astrology
Qmgr: set queue long enabled = True
Qmgr: set queue long started = True

Qmgr: create queue short
Qmgr: set queue short queue_type = Execution
Qmgr: set queue short from_route_only = True
Qmgr: set queue short resources_max.cput = 01:00:00
Qmgr: set queue short resources_max.walltime = 01:00:00
Qmgr: set queue short enabled = True
Qmgr: set queue short started = True

Qmgr: create queue medium
Qmgr: set queue medium queue_type = Execution
Qmgr: set queue medium from_route_only = True
Qmgr: set queue medium enabled = True
Qmgr: set queue medium started = True
Qmgr: set server default_queue = submit
```

Notice that the `long` and `short` queues have time limits specified. This will ensure that jobs of certain sizes will enter (or be prevented from entering) these queues. The last queue, `medium`, has no limits, thus it will be able to accept any job that is not routed into any other queue.
Lastly, note the last line in the example above, which specified that the default queue is the new submit queue. This way users will simply submit their jobs with the resource and architecture requests, without specifying a queue, and PBS will route the job into the correct location. For example, if a user submitted a job with the following syntax, the job would be routed into the server_2 queue:

```
qsub -l select=arch=sv2:ncpus=4 testjob
```

### 10.5 External Software License Management

PBS Professional can be configured to schedule jobs based on externally-controlled licensed software. A detailed example is provided in "Example of Floating, Externally-managed License with Features" on page 373 in the PBS Professional Administrator’s Guide.
10.6 Multiple User ACL Example

A site may have a need to restrict individual users to particular queues. In the previous example we set up queues with group-based ACLs, in this example we show user-based ACLs. Say a site has two different groups of users, and wants to limit them to two separate queues (perhaps with different resource limits). The following example illustrates this.

```
Omgr: create queue structure
Omgr: set queue structure queue_type = Execution
Omgr: set queue structure acl_user_enable = True
Omgr: set queue structure acl_users = curly
Omgr: set queue structure acl_users += jerry
Omgr: set queue structure acl_users += larry
Omgr: set queue structure acl_users += moe
Omgr: set queue structure acl_users += tom
Omgr: set queue structure resources_max.nodes = 48
Omgr: set queue structure enabled = True
Omgr: set queue structure started = True

Omgr: create queue engine
Omgr: set queue engine queue_type = Execution
Omgr: set queue engine acl_user_enable = True
Omgr: set queue engine acl_users = bill
Omgr: set queue engine acl_users += bobby
Omgr: set queue engine acl_users += chris
Omgr: set queue engine acl_users += jim
Omgr: set queue engine acl_users += mike
Omgr: set queue engine acl_users += rob
Omgr: set queue engine acl_users += scott
Omgr: set queue engine resources_max.nodes = 12
Omgr: set queue engine resources_max.walltime=04:00:00
Omgr: set queue engine enabled = True
Omgr: set queue engine started = True
```
This chapter lists the error messages generated when limits are exceeded. See "Managing Resource Usage By Users, Groups, and Projects, at Server & Queues" on page 389 in the PBS Professional Administrator’s Guide.

### 11.1 Run Limit Error Messages

When a job would exceed a limit by running, the job’s comment field is set to one of the following messages. The following table shows the limit attribute, where the limit is applied, to whom the limit is applied, and the message.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Where Applied</th>
<th>To What Applied</th>
<th>Message</th>
</tr>
</thead>
<tbody>

## 14.1 PBS Environment Variables

The following table lists the PBS environment variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Origin</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCPUS</td>
<td></td>
<td>Number of threads, defaulting to number of CPUs, on the vnode</td>
</tr>
<tr>
<td>OMP_NUM_THREADS</td>
<td></td>
<td>Same as NCPUS.</td>
</tr>
<tr>
<td>PBS_ARRAY_ID</td>
<td>Server</td>
<td>Identifier for job arrays. Consists of sequence number.</td>
</tr>
<tr>
<td>PBS_ARRAY_INDEX</td>
<td>Server</td>
<td>Index number of subjob in job array.</td>
</tr>
<tr>
<td>PBS_CONF_FILE</td>
<td></td>
<td>Path to pbs.conf</td>
</tr>
<tr>
<td>PBS_CPUSET_DEDICTED</td>
<td>Set by mpiexec</td>
<td>Asserts exclusive use of resources in assigned cpuset.</td>
</tr>
<tr>
<td>PBS_DEFAULT</td>
<td></td>
<td>Name of default PBS server</td>
</tr>
<tr>
<td>PBS_ENVIRONMENT</td>
<td></td>
<td>Indicates job type: <strong>PBS_BATCH</strong> or <strong>PBS_INTERACTIVE</strong></td>
</tr>
<tr>
<td>PBS_JOBCOOKIE</td>
<td></td>
<td>Unique identifier for inter-MoM job-based communication.</td>
</tr>
<tr>
<td>PBS_JOBDIR</td>
<td></td>
<td>Pathname of job-specific staging and execution directory</td>
</tr>
</tbody>
</table>
## PBS Environment Variables

Table 14-1: PBS Environment Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Origin</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBS_JOBID</td>
<td>Server</td>
<td>The job identifier assigned to the job or job array by the batch system.</td>
</tr>
<tr>
<td>PBS_JOBNAME</td>
<td>User</td>
<td>The job name supplied by the user.</td>
</tr>
<tr>
<td>PBS_MOMPORT</td>
<td></td>
<td>Port number on which this job’s MoMs will communicate.</td>
</tr>
<tr>
<td>PBS_NODEFILE</td>
<td></td>
<td>The filename containing a list of vnodes assigned to the job.</td>
</tr>
<tr>
<td>PBS_NODENUM</td>
<td></td>
<td>Logical vnode number of this vnode allocated to the job.</td>
</tr>
<tr>
<td>PBS_O_HOME</td>
<td>Submission environment</td>
<td>Value of HOME from submission environment.</td>
</tr>
<tr>
<td>PBS_O_HOST</td>
<td>Submission environment</td>
<td>The host name on which the qsub command was executed.</td>
</tr>
<tr>
<td>PBS_O_LANG</td>
<td>Submission environment</td>
<td>Value of LANG from submission environment</td>
</tr>
<tr>
<td>PBS_O_LOGNAME</td>
<td>Submission environment</td>
<td>Value of LOGNAME from submission environment</td>
</tr>
<tr>
<td>PBS_O_MAIL</td>
<td>Submission environment</td>
<td>Value of MAIL from submission environment</td>
</tr>
<tr>
<td>PBS_O_PATH</td>
<td>Submission environment</td>
<td>Value of PATH from submission environment</td>
</tr>
<tr>
<td>PBS_O_QUEUE</td>
<td>Submission environment</td>
<td>The original queue name to which the job was submitted.</td>
</tr>
<tr>
<td>PBS_O_SHELL</td>
<td>Submission environment</td>
<td>Value of SHELL from submission environment</td>
</tr>
<tr>
<td>PBS_O_SYSTEM</td>
<td>Submission environment</td>
<td>The operating system name where qsub was executed.</td>
</tr>
</tbody>
</table>
### Table 14-1: PBS Environment Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Origin</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBS_O_TZ</td>
<td>Submission</td>
<td>Value of <code>TZ</code> from submission environment</td>
</tr>
<tr>
<td>PBS_O_WORKDIR</td>
<td>Submission</td>
<td>The absolute path of directory where <code>qsub</code> was executed.</td>
</tr>
<tr>
<td>PBS_QUEUE</td>
<td>Submission</td>
<td>The name of the queue from which the job is executed.</td>
</tr>
<tr>
<td>PBS_SERVER</td>
<td>Submission</td>
<td>The name of the default PBS server.</td>
</tr>
<tr>
<td>PBS_TASKNUM</td>
<td>Submission</td>
<td>The task (process) number for the job on this vnode.</td>
</tr>
<tr>
<td>PBS_TMPDIR</td>
<td></td>
<td>The job-specific temporary directory for this job.</td>
</tr>
</tbody>
</table>

See "Discovering Last Reboot Time of Server" on page 1024 in the PBS Professional Administrator’s Guide.
The server, scheduler and MoM all write messages to their log files. Which messages are written depends upon each daemon’s event mask. See "Event Logging" on page 1015 in the PBS Professional Administrator’s Guide.

A few log messages are listed here.

**Table 16-1: cput and mem Logged by Mother Superior**

<table>
<thead>
<tr>
<th>Logs</th>
<th>Mother Superior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0100</td>
</tr>
<tr>
<td>Form</td>
<td>Date; Time; event class; reporting daemon; Job; Job ID; Hostname; cput; mem</td>
</tr>
<tr>
<td>Example</td>
<td>07/02/2007 19:47:14;0100;pbs_mom;Job;40.pepsi;pepsi cput= 0:00:00 mem=4756kb</td>
</tr>
<tr>
<td>Explanation</td>
<td>On job exit, Mother superior logs the amount of cput and mem used by this job on each node.</td>
</tr>
</tbody>
</table>

**Table 16-2: MoM Adds $clienthost Address**

<table>
<thead>
<tr>
<th>Logs</th>
<th>MoM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Event level 0x0002, event class server</td>
</tr>
<tr>
<td>Form</td>
<td>Adding IP address XXX.XXX.XXX.XXX as authorized</td>
</tr>
<tr>
<td>Example</td>
<td>Adding IP address 127.0.0.1 as authorized</td>
</tr>
</tbody>
</table>
Chapter 16

Log Messages

Table 16-2: MoM Adds $clienthost Address

| Explanation | When MoM starts up, she logs the addresses associated with a host listed in Mom's config file in $clienthost statements. When MoM receives the list from the server, addresses associated with other MoMs in the PBS complex will be listed. This occurs as soon as MoM and the server establish communication and again whenever a node goes down and comes back up, or there is a change to the list of execution hosts (node added to or deleted from the complex). That event and the associated logging may occur at any time. |

Table 16-3: Scheduler: Job is Invalid

<table>
<thead>
<tr>
<th>Logs</th>
<th>Scheduler</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0080</td>
</tr>
<tr>
<td>Form</td>
<td>Job is invalid - ignoring for this cycle</td>
</tr>
<tr>
<td>Example</td>
<td>Job is invalid - ignoring for this cycle</td>
</tr>
<tr>
<td>Explanation</td>
<td>Job failed a validity check such as 1) no egroup, euser, select, place, 2) in peer scheduling, pulling server is not a manager for furnishing server, 3) internal scheduler memory failure</td>
</tr>
</tbody>
</table>

Table 16-4: Scheduler: Message Indicating Whether It Is Prime Time

<table>
<thead>
<tr>
<th>Logs</th>
<th>Scheduler</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0100 (256)</td>
</tr>
<tr>
<td>Form</td>
<td>“It is <em>P</em>. It will end in XX seconds at MM/DD/YYYY HH:MM:SS”</td>
</tr>
<tr>
<td>Example</td>
<td>“It is prime time. It will end in 29 seconds at 03/10/2007 09:29:31”</td>
</tr>
<tr>
<td>Explanation</td>
<td>The scheduler is declaring whether the current time is prime time or non-prime time. The scheduler is stating when this period of prime time or non-prime time will end.</td>
</tr>
</tbody>
</table>
## Log Messages

### Table 16-5: Jobs that Can Never Run

<table>
<thead>
<tr>
<th>Logs</th>
<th>Scheduler</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0080</td>
</tr>
<tr>
<td>Form</td>
<td>“resource request is impossible to solve: job will never run”</td>
</tr>
<tr>
<td>Example</td>
<td>“resource request is impossible to solve: job will never run”</td>

<td>“created the job directory /Users/user1/pbsjobs/345.myhost”</td>
</tr>
<tr>
<td>Explanation</td>
<td>PBS created a job-specific execution and staging directory</td>
</tr>
</tbody>
</table>

#### Table 16-9: Failure to Create Job-specific Directory

<table>
<thead>
<tr>
<th>Logs</th>
<th>MoM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0001</td>
</tr>
<tr>
<td>Form</td>
<td>“unable to create the job directory &lt;unique_job_dir_name&gt;”</td>
</tr>
<tr>
<td>Example</td>
<td>“unable to create the job directory /Users/user1/pbsjobs/345.myhost”</td>
</tr>
<tr>
<td>Explanation</td>
<td>The MoM was unable to create the job-specific staging and execution directory</td>
</tr>
</tbody>
</table>

#### Table 16-10: Failure to Validate $jobdir_root MoM Parameter

<table>
<thead>
<tr>
<th>Logs</th>
<th>MoM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0001</td>
</tr>
<tr>
<td>Form</td>
<td>”&lt;file&gt;[&lt;linenum&gt;]command “$jobdir_root &lt;full path&gt;” failed, aborting”</td>
</tr>
<tr>
<td>Example</td>
<td>”config[3] command “$jobdir_root /foo/dir” failed, aborting”</td>
</tr>
<tr>
<td>Explanation</td>
<td>$jobdir_root exists in the MoM’s configuration file, and the MoM was unable to validate $jobdir_root; MoM has aborted</td>
</tr>
</tbody>
</table>
Table 16-11: Job Eligible Time

<table>
<thead>
<tr>
<th>Logs</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>0x0400</td>
</tr>
<tr>
<td>Form</td>
<td>MM/DD/YYYY hh:mm:ss;log event;Server@hostname;Job;jobID;job accrued 23 secs of &lt;previous sample type&gt;, new accrue_type=&lt;next_sample_type&gt;, eligible_time=&lt;current amount of eligible_time&gt;</td>
</tr>
<tr>
<td>Example</td>
<td>08/07/2007 13:xx:yy;0040;Server@myhost;Job;163.myhost;job accrued 23 secs of eligible_time, new accrue_type=run_time, eligible_time=00:00:23</td>
</tr>
<tr>
<td>Explanation</td>
<td>Previous sample was of eligible time; next sample will be of run_time, job has accrued 23 seconds of eligible_time.</td>
</tr>
</tbody>
</table>

Table 16-12: Invalid Syntax for Standing Reservation

Introduction to PBS

17.1 Acknowledgements

PBS Professional is the enhanced commercial version of the PBS software originally developed for NASA. The NASA version had a number of corporate and individual contributors over the years, for which the PBS developers and PBS community is most grateful. Below we provide formal legal acknowledgements to corporate and government entities, then special thanks to individuals.

The NASA version of PBS contained software developed by NASA Ames Research Center, Lawrence Livermore National Laboratory, and MRJ Technology Solutions. In addition, it included software developed by the NetBSD Foundation, Inc., and its contributors as well as software developed by the University of California, Berkeley and its contributors.

Other contributors to the NASA version of PBS include Bruce Kelly and Clark Streeter of NERSC; Kent Crispin and Terry Heidelberg of LLNL; John Kochmar and Rob Pennington of Pittsburgh Supercomputing Center; and Dirk Grunwald of University of Colorado, Boulder. The ports of PBS to the Cray T3e and the IBM SP SMP were funded by DoD USAERDC; the port of PBS to the Cray SV1 was funded by DoD MSIC.

No list of acknowledgements for PBS would possibly be complete without special recognition of the first two beta test sites. Thomas Milliman of the Space Sciences Center of the University of New Hampshire was the first beta tester. Wendy Lin of Purdue University was the second beta tester and holds the honor of submitting more problem reports than anyone else outside of NASA.
